DRAFT

EXECUTIVE SUMMARY

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by the Western Parkland City Authority (WPCA or 'the Client') to conduct a Detailed Site Investigation (DSI) of the site identified as the Bradfield development area, located at 215 Badgerys Creek Road, Bringelly NSW (the Site).

ERM undertook a Preliminary Site Investigation (PSI) in June 2021 to refine the understanding surrounding potential contamination associated with recent and historical land use practices undertaken within the Site and surrounding area that may require consideration during future redevelopment works. Based on the outcomes of the PSI, a Detailed Site Investigation (DSI) was recommended to further assess the potential for soil and / or groundwater contamination to be present.

This DSI was undertaken in general accordance with the Site Auditor approved ERM (2021) Sampling and Analysis Quality Plan (SAQP) which was developed to describe the required Data Quality Objectives (DQOs) and field investigation methods for undertaking this DSI.

The overall objective of the DSI was to assess the potential existence and distribution / extent of contamination in soil, sediments, surface water, and groundwater and to identify potential remediation / site management requirements to facilitate the subsequent redevelopment works at the Site.

Results of the DSI indicated the following:

- Fill materials were observed to extend to a maximum depth of 0.4 metres below ground level (m bgl). During investigation works there was no evidence of staining / odours or anthropogenic inclusions such as bricks, rubble, potential Asbestos Containing Material (ACM) etc. noted within the majority of fill materials, with the exception of those located in the area around the former married quarters, and an isolated (one location) observation of bitumen within topsoil. Based on the consistent depth of fill it is considered that there is a low risk of significant burials of uncontrolled fill materials within the Site;
- Natural materials were generally encountered at surface or at depths ranging between 0.1 and 0.4 m bgl in locations with identified overlying fill. Natural materials were generally comprised of brown and red clays;
- Soil samples that were analysed for Contaminants of Potential Concern (CoPCs) were all reported at concentrations below the laboratory Limit of Reporting (LOR) and / or the adopted screening values within the collected samples with the exception of heavy metals (copper, nickel and zinc) and one exceedance of the adopted site ecological screening value for per-and polyfluoroalkyl substances (PFAS). The minor detections of heavy metals and PFAS were not considered to be indicative of widespread contamination and did not warrant further investigation or remediation;
- Whilst no potential ACM was observed or reported in laboratory results during this investigation, it is noted that previous investigations have observed ACM in soils within the former married quarters area. The potential for ACM to be present in fill, particularly within this area remains;
- Surface water samples were analysed for CoPCs. All samples were found to exceed the adopted heavy metal (copper, lead, nickel and zinc) ecological screening values and three samples exceeded the adopted ecological screening value for Perfluorooctane sulfonate (PFOS). All other analytes were below the adopted screening values. Exceedances were considered a result of migration from up-gradient sources into the site in surface waters, noting that PFAS and heavy metals is widespread at low levels in urban environments. The reported exceedances are not indicative of significant / widespread contamination that requires further assessment and given the proposed development of the site into a city centre, the reported exceedances of the adopted ecological screening values are not considered likely to pose a significant risk following site development;

DRAFT

- Sediment samples were analysed for PFAS, all samples reported concentrations below the laboratory LOR. No visual signs of contamination such as odours / staining were noted within the sediments collected;
- Groundwater was identified within the Site at depths ranging from 2.110 m below top of casing (m btoc) (MW08) to 9.721 m btoc (MW07). During groundwater sampling works, no indication of sheen, odours or other visual / olfactory indicators of contamination were noted. A survey of groundwater wells was completed to allow for calculation of groundwater levels in relation to the Australian Height Datum (AHD). The calculation indicated that groundwater on site was flowing towards the south east; and
- Groundwater samples returned concentrations of CoPCs less than the laboratory LOR and / or the adopted screening values within all collected samples with the exception of minor exceedances of the adopted freshwater screening values for heavy metals. It is considered that based on identified heavy metals detected within soils and site conditions observed during completion of this DSI, that the identified slightly elevated heavy metals concentrations within the analysed groundwater samples are likely representative of natural background conditions and are not indicative of significant anthropogenic contamination that requires further assessment.

Based on field observations made during site investigations works, results of collected soil, groundwater, surface water and sediment samples and in consideration of the updated CSM presented within Section 8, it is the opinion of ERM that the site is suitable for land uses permitted under the National Environment Protection (Assessment of Site Contamination) HIL-A criteria. The proposed development, which will be mixed use and include medium to high density residential, commercial, light industrial, retail, hotel, childcare, community and education which are all uses permitted under HIL-A.

ERM recommends that prior to the commencement of construction works an Asbestos Management Plan (AMP) should be implemented. The purpose of the AMP will be to manage the fill materials within the former married quarters area previously identified as containing ACM and also the potential for asbestos containing conduits to be encountered during earth works.

DRAFT

1. INTRODUCTION AND OBJECTIVES

1.1 Introduction

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by the Western Parkland City Authority (WPCA, or 'the Client') to conduct a Detailed Site Investigation (DSI) of the part of the area identified as the Bradfield City Centre as defined in **Figure 2** (the Site), located at 215 Badgerys Creek, Bringelly New South Wales (NSW).

- The site location is illustrated on **Figure 1**. The current layout of the Site and surrounds is presented in **Figure 2**.

1.2 Background

Due to project master planning requirements WPCA is seeking to undertake a staged investigation of the Site to facilitate early development of certain areas. To assist with planning requirements, ERM undertook a Preliminary Site Investigation (PSI) in February 2021 of the Site and immediately adjacent lands (as summarised in Section 3). Refer to **Figure 2.**

The objective of the PSI was to refine the understanding of potential contamination resulting from current and historical land use practices undertaken within the Commonwealth Land and surrounding area and to aid WPCA in assessing potential liabilities that may require consideration during future redevelopment works.

Based on information reviewed as part of the PSI, ERM identified some potential risks associated with a number of historical land use practices undertaken within the Site and in the surrounding area that warranted further assessment. ERM therefore recommended the completion of a Detailed Site Investigation (DSI) to further assess the potential for soil and / or groundwater impacts to be present. A summary of previous investigations and findings is presented in **Section 3**.

This DSI was undertaken in general accordance with ERM (2021) Sampling and Analysis Quality Plan (SAQP) which was developed to describe the required Data Quality Objectives (DQOs) and field investigation methods for undertaking this DSI.

1.3 Project Objectives

The overall objectives of the DSI were to assess the potential distribution / extent of contamination in soil, groundwater, sediments and surface water and identify potential remediation / site management requirements to enable subsequent redevelopment works at the Site.

- Development plans for the Bradfield City site include the development of commercial / industrial, medium and high density residential, educational, community, retail, hotel and childcare building structures and associated service infrastructure (roads, utility services etc.). Investigation works for the Site have been detailed within a separate SAQP.
- ERM also notes Sydney Metro is undertaking and managing works within the central and northern portions of the Site and hence those parts of the site were inaccessible. The central portion of the site has been subject to a separate investigation undertaken by GHD and has been excluded from this DSI. Areas of the site covered by this investigation are illustrated on **Figure 2.**

1.4 Scope of Works

To achieve the objectives outlined above, ERM completed the general requirements set out in the SAQP (ERM July 2021) and summarised below:

- project preliminaries including preparation of a site specific Health and Safety Plan (HaSP) and completion of subsurface utility clearance requirements;
- soil investigation works (locations shown on **Figure 4**) including:

DRAFT

  - completion of 248 test pit locations and 42 soil bore locations to assess potential contamination within onsite soils and gain a more detailed understanding of the potential nature and distribution of fill material;
- groundwater investigation works (locations shown on **Figure 4**) including:
  - the installation of 11 groundwater monitoring wells to a maximum depth of 12 m bgl; and
  - completion of a groundwater monitoring event (GME) including the gauging and sampling of 11 newly installed wells in June 2022.
- surface water and sediment investigation works (locations shown on **Figure 4**) including:
  - the collection of 10 sediment samples from onsite drainage lines and overland flow paths; and
  - the collection of 9 surface water samples from onsite drainage lines and overland flow paths.
- submission of collected soil, groundwater, surface water and sediment samples to a laboratory NATA accredited for analysis of identified COPCs; and
- Interpretation of the results of laboratory testing in the context of the Site Assessment Criteria, field observations, local geology and hydrogeology and the history of the site; and preparation of this investigation report.

1.5 Regulatory Requirements

- ANZAST (2018). Australian and New Zealand Guidelines for Fresh and Marine Water Quality. (ANZG);
- Australian Standard (2005). AS 4482.1 2005, Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 2: Non-volatile and Semi-volatile compounds;
- Australian Standard (1999). AS 4482.2 1999, Guide to the Sampling and Investigation of Potentially Contaminated Soil, Part 2: Volatile Substances;
- Heads of Environment Protection Authority (2020). PFAS National Environmental Management Plan. This is hereafter referred to as ‘the NEMP, 2020’;
- National Environment Protection Council (2013). National Environment Protection (Assessment of Site Contamination) Measure 1999. This is hereafter referred to as ‘the ASC NEPM;
- National Health and Medical Research Council (2008). Guidelines for Managing Risks in Recreational Waters;
- National Health and Medical Research Council (2011). Australian Drinking Water Guidelines ADWG [updated August 2018];
- National Health and Medical Research Council/National Resource Management Ministerial Council, Commonwealth of Australia, Canberra (2011). Australian drinking water guidelines paper 6 national water quality management strategy;
- WA Department of Health (2009). Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia;
- Interim Guideline on the Assessment and Management of Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS), WA Department of Environment Regulation (2017); and
- Perfluorinated Chemicals in Food, Food Standards Australia and New Zealand (2017). This is hereafter referred to as ‘FSANZ’;
- National Environment Protection (Assessment of Site Contamination) Measure 1999 (NEPC, 2013) - herein referred to as the ASC NEPM (2013);
- NSW EPA (2017) Guidelines for the NSW Site Auditor Scheme (3rd edition); and
- NSW EPA (2020) Consultants reporting on contaminated land, contaminated land guidelines.

DRAFT

1.6 Limitations

This report was prepared in accordance with the scope of work outlined within this report and subject to the applicable cost, time and other constraints. ERM performed the services in a manner consistent with the normal level of care and expertise exercised by members of the environmental profession. ERM makes no warranty concerning the suitability of the Site for any purpose or the permissibility of any use, development or re-development of the Site.

Except as otherwise stated, ERM's assessment is limited strictly to identifying specified environmental conditions associated with the subject Site and does not evaluate structural conditions of any buildings on the subject Site. Lack of identification in the report of any hazardous or toxic materials on the subject Site should not be interpreted as a guarantee that such materials do not exist on the Site.

This assessment is based on Site inspection conducted by ERM personnel, sampling and analyses described in the report, and information provided by WPCA or other people with knowledge of the Site conditions. All conclusions and recommendations made in the report are the professional opinions of the ERM personnel involved with the project and, while normal checking of the accuracy of data has been conducted, ERM assumes no responsibility or liability for errors in data obtained from such sources, regulatory agencies or any other external sources, nor from occurrences outside the scope of this project.

ERM is not engaged in environmental consulting and reporting for the purpose of advertising, sales promoting, or endorsement of any client interests, including raising investment capital, recommending investment decisions, or other publicity or investment purposes.

ERM PREPARED THIS REPORT FOR THE SOLE AND EXCLUSIVE BENEFIT AND USE OF THE WESTERN PARKLAND CITY AUTHORITY (WPCA). NOTWITHSTANDING DELIVERY OF THIS REPORT BY ERM OR WPCATO ANY THIRD PARTY, UNLESS OTHERWISE EXPRESSLY AGREED, ANY COPY OF THIS REPORT PROVIDED TO A THIRD PARTY IS PROVIDED FOR INFORMATIONAL PURPOSES ONLY, WITHOUT THE RIGHT TO RELY AND ERM DISCLAIMS ALL LIABILITY TO SUCH THIRD PARTY TO THE EXTENT PERMITTED BY LAW. ANY USE OF THIS REPORT BY A THIRD PARTY IS DEEMED TO CONSTITUTE ACCEPTANCE OF THIS LIMITATION.

DRAFT

2. SITE BACKGROUND INFORMATION

2.1 Site Identification

Site identification information is presented in the table below

Table 2.1 Site Identification Details

Item	Description
Site Address	215 Badgerys Creek Rd, Bringelly NSW 2556
Lot and Deposited Plan	Part Lot 10 in Deposited Plan (DP) 1235662
Local Government Area	City of Liverpool Council
Zoning	■ The majority of the site is zoned as MU (Mixed Use) with the southern and eastern boundary of The Site zoned as ENZ (Environment and Recreation). ■ The north western portion of the Site is zoned as ENT (Enterprise) under the State Environment and Planning Policy (Western Sydney Aerotropolis) 2020. ■ Refer to **Appendix H** – Zoning Plan
Site Area	Approximately 94.56 hectares (ha) (excludes First building area and Sydney Metro site area)
Geographic Co-ordinates	Site boundary co-ordinates are as listed on **Figure 3**.

2.2 Site Setting

The following sections summarise the information obtained during the site background and history review.

- A copy of relevant database search results is provided in Appendix C within the ERM (2021) PSI**.**

Table 2.2 Site Identification Details

Item	Description
Historical and Current land-use	■ The Site forms part of the larger lot (Lot 10) acquired by the Commonwealth in 1959 for use as the Royal Australian Air Force (RAAF) Bringelly Radio Receiving Station (the 'Commonwealth land'). ■ The Bringelly Radio Receiving Station closed in 2005. ■ The Site was acquired by WPCA from the Commonwealth in 2020. ■ The buildings associated with the former Radio Receiving Station were demolished in 2022. ERM notes that the radio receiving station buildings were located within the central compound portion of the Site within the Sydney Metro site area and are excluded from this investigation.
Surrounding Land use	The land uses surrounding the site include: ■ **North**: Directly north of the Site is agricultural land followed by low density / semi-rural residence (approximately 290 m north of the Site). Residential properties are located approximately 550 m north of the Site and beyond. The north western boundary of the Site forms part of the Commonwealth land and is comprised of the area identified as Priority Area 1 which is subject to a separate SAQP and investigation (ERM 2022). ■ **South**: Directly south of the Site is a strip of vegetation followed by Thompsons Creek located approximately 40 m south of the Site. An area of rural residential housing lies beyond Thompsons Creek. ■ **East**: Thompsons Creek runs along the majority of the eastern border of the Site beyond which is The Retreat Road located approximately 115 m east of the Site. Residential properties are located approximately 150 m to the east of the Site and beyond.

DRAFT

Item	Description
	■ **West**: Directly west of the Site are residential properties which extend for approximately 500 m and beyond. ERM notes that the central and northern portion of the Site is comprised of the Sydney Metro site area. While this is located within the Site area it was excluded from this investigation and as such is considered as "offsite" for the purposes of developing conceptual site models (CSM) and subsequent sampling strategies.
Site Elevation	■ The Site elevation ranges from 62 m relative to Australian Height Datum (AHD) within the north eastern portion of the Site to approximately 98 m AHD within the south western portion.
Topography	■ Topography within the surrounding area is variable with gentle / undulating slopes generally in a south easterly direction.
Hydrology	■ The nearest surface water body to the Site is Moore Gully which crosses the western boundary of the Site and enters Thompsons Creek at the eastern boundary of the Site. ■ Five unnamed ephemeral drainage lines are indicated on site mapping to flow through the Site and into Thompsons Creek to the south and east. ■ Thompsons Creek is a South Creek tributary with the confluence between the two creeks occurring approximately 1.3 km north-east of the Site.
Geology, Soils and Acid Sulfate Soils	■ The Penrith 1:100,000 Geological Mapping Sheet identifies the underlying geology as Bringelly Shale and is described as shale, carbonaceous claystone, claystone, laminite, fine to medium grained lithic sandstone, rare coal and tuff from the Middle Triassic age. ■ The soil landscape of the Site is described as ridge and valley country of gently undulating ridge tops and steep side slopes often with slumping and rounded hilly to steep hilly areas and relatively narrow valleys. Chief soils are hard acidic red soils (with hard acidic yellow mottled soils in places some ironstone gravels occur in both these soils. Associated are hard neutral and alkaline red soils and in saddles and some mid-slope positions soils, usually in depressions; and small areas of undescribed soils in wet soaks and valley areas. Small areas of other soils are likely throughout. ■ According to the Atlas of Australian Acid Sulfate Soils (ASS), ASS onsite and within the search buffer have an extremely low probability of occurrence. There is a 1-5% chance of occurrence with occurrences in small localised areas.
Hydrogeology	■ Previous investigations undertaken within the Site by ERM in 2021 (summarised in Section 3) identified groundwater at variable depths ranging from approximately 2.5 m bgl to 13 m bgl within underlying fractured shale bedrock (Bringelly Shale). ■ A search of registered groundwater bores identified five groundwater bores within the Site boundary. All bores were reported to be drilled for monitoring purposes. ■ A search of registered groundwater bores within a 2 km buffer from the Site identified eight registered groundwater bores. ■ Two of these bores were reported to be drilled for domestic / stock purposes, three were reported to be drilled for monitoring purposes, one for domestic / industrial / stock purposes and one for domestic purposes. ■ Aquifers onsite and within the buffer area are described as porous, extensive aquifers of low to moderate productivity. ERM notes that groundwater within the Bringelly Shale is often saline (due the marine derived nature of the Bringelly Shale) and may be unsuitable for beneficial uses.

2.3 Site History and Background Information

A detailed summary of site history and background information for the broader Site is presented within Section 7.0 of the ERM (2021) PSI. A brief summary of the ERM (2021) PSI as it relates to the Site is presented within Section 3 below.

DRAFT

3. PREVIOUS INVESTIGATIONS

The primary and most recent previous investigation relied upon in developing this DSI was the ERM (2021) Aerotropolis Core Precinct – Review of Contamination Issues, 17th June 2021 (ERM 2021 PSI), a summary of which is presented later in this section.

To inform the preparation of that document, ERM undertook a review of the following previous reports relevant to the Site and broader Aerotropolis Core Precinct:

- Environmental Resources Management Pty Ltd (2022) Detailed Site Investigation, First Building Area Bradfield City Centre NSW (ERM 2022);
- Environmental Resources Management Pty Ltd (2011) RAAF Bringelly Receiving Station NSW, Heritage Assessment, 18 April 2011 (ERM 2011);
- GHD (2011) Department of Defence Support Group, Bringelly RAAF Receiving Station, Infrastructure Assessment Report, April 2011 (GHD 2011);
- Golder Associates (2011) Detailed Site Investigation, Former RAAF Bringelly Receiving Station, October 2011 (Golder 2011);
- Golder Associates (2011a) Hazardous Building Materials Assessment, Former RAAF Bringelly Receiving Station, April 2011 (Golder 2011);
- Sweett Group Pty Ltd (2011) Bringelly RAAF Receiving Station, Bringelly, NSW. Stage 1 Overarching Report – Summary Outcomes of Due Diligence Investigations, August 2011 (Sweett 2011);
- GTek Pty Ltd (2011) Post Activity Report Unexploded Ordnance (UXO) Consultancy Services RAAF Receiving Station Site Bringelly, NSW, 13th January 2011 (GTek 2011);
- Golder Associates (2014) Remedial Action Plan, Former RAAF Bringelly Receiving Station, April 2014 (Golder 2014);
- Deloitte Pty Ltd (2015) Defence Housing Australia Bringelly RAAF Receiving Station, 13th March 2015 (Deloitte 2015);
- Western Environmental Pty Ltd (2019) 215 Badgerys Creek Road, Bringelly, NSW, Detailed Site Investigation Report, 12 December 2019 (Western Environmental 2019);
- Thuroona Services Pty Ltd (2019) Cost Estimate Report - 215 Badgerys Creek Road, Bringelly, NSW, 24 December 2019 (Thuroona 2019);
- Arup Australia Pty Ltd (2020) Sydney Metro Greater West Technical Paper 7: Groundwater, 4th June 2020 (Arup 2020);
- M2A Pty Ltd (2020) Sydney Metro Greater West Technical Paper 6: Flooding, Hydrology and Water Quality (M2A 2020);
- M2A Pty Ltd (2020) Sydney Metro Greater West Technical paper 8: Contamination (M2A 2020a);
- Aerocon Australia Pty Ltd (2020) Western Sydney Aerotropolis Constraints and Land Capability Assessment – Stage 1 Report, September 2020 (Aurecon 2020); and
- Sydney Water Pty Ltd (2020), Aerotropolis Initial Precincts Stormwater and Water Cycle Management Study Interim Report, September 2020 (Sydney Water 2020).

DRAFT

ERM notes that following completion of the ERM (2021) PSI, ERM completed the ERM (2021) Aerotropolis Core Precinct Targeted Site Investigation (TSI), 21 May 2021 (ERM 2021a) to assess the potential for PFAS and uncontrolled fill material to be present within targeted areas of the Site. A brief summary of contamination issues identified within the above reports has been provided in Section 3.2, a more detailed summary of both the ERM 2021 PSI and ERM 2021a TSI is presented below. An additional, separate DSI report was prepared for the First building area, completed 10 June 2022 and aimed at providing a detailed investigation into the potential for soil and groundwater contamination to be present in the First building area.

ERM (2021) PSI

ERM was engaged by WPCA to undertake a PSI of the Aerotropolis Core Precinct (which encompassed the Site and is now known as the Bradfield City Centre). The PSI was undertaken to assist in the development of a master plan being prepared by the WPCA.

The objective of the PSI was to undertake a review of previously identified contamination issues and refine the current understanding of site conditions to aid WPCA in assessing potential liabilities and constraints associated with site contamination that may require consideration during master planning and subsequent development works.

Information provided to ERM as part of the PSI indicated that the concept plan for the proposed redevelopment of the Aerotropolis Core Precinct included the following key features:

- The Moore Gully Billabongs, Thompson Park and a Waterfront Precinct located within the southern portion of the Aerotropolis Core;
- Educational facilities, a metro plaza, green gateways and sports fields located within the central portion of the Aerotropolis Core;
- Manufacturing / industrial lands, CSIRO facility, TAFE / multiversity and hotel located within the northern portion of the Aerotropolis Core; and
- Proposed landscaping which would include open water bodies for flood water storage / adaptive re-use, swimming and play area within the existing Moore Gully alignment and planted native vegetation throughout.

Scope of Works

To meet the project objective, ERM completed the following scope of works:

- Review of background information (previous investigations, relevant database searches); and
- Targeted groundwater, surface water and sediment sampling to aid in refining the understanding of potential PFAS impacts.

Discussion of Results

The Site is located within an area surrounded by rural residential, low density residential and commercial / industrial development. At the time of the PSI the land was largely vacant with the exception of former Defence infrastructure located within the central portion of the Site.

- Information from previous investigations indicated that the Site was first granted to private owners by the Crown in 1818. From this time until 1957 the Site underwent various ownerships and was utilized for agricultural purposes. In 1957 the land was transferred to the Commonwealth of Australia. The Site was used for Department of Defence purposes as a radar installation from 1957 until prior to 2005. In 2020, WPCA acquired the land from the Commonwealth to develop the Bradfield City Centre on behalf of the NSW Government;

DRAFT

- Results from the desktop assessment indicated that the Site is primarily underlain by the Bringelly Shale which is described as shale, carbonaceous claystone, claystone, laminite, fine to medium grained lithic sandstone, rare coal and tuff from the Middle Triassic age. Groundwater within the Site was identified during previous investigations and gauging undertaken as part of the PSI to be present at depths of approximately 2.5 – 7.5 metres below ground level (m bgl);
- Previous investigations identified a range of potential contamination issues in the Site that require remediation and / or site management including former fuel storage USTs and asbestos impacted fill located within stockpiled fill to the south of the main compound and within the vicinity of the former married quarters:
    - During the site inspection undertaken as part of the PSI, ERM noted the potential for additional fill material to be present within Moore Gully. Fill within this area was noted to contain bricks and other demolition wastes. ERM noted that, at that time, no samples had been collected from this material to assess the potential for contamination to be present;
- Analytical results from collected sediment, surface water and groundwater samples as part of the PSI, returned concentrations of PFAS compounds less than the laboratory Limit of Reporting (LOR) and / or the adopted screening values with the exception of surface water samples SW2, SW8 and SW11 (located within the eastern portion of the Commonwealth Land). These samples returned results that exceeded the adopted drinking water guideline and the adopted 99% freshwater guideline for protection of aquatic ecosystems:
    - It was considered that the above results were generally consistent with previous investigations of PFAS undertaken as part of the Western Environmental (2020) investigation. While the specific source of PFAS was unclear, the results of the PSI sampling indicated the potential for PFAS to be migrating from offsite sources; and
    - ERM noted that further assessment of potential PFAS should be undertaken within the Site to assess the potential for historical sources of PFAS to be located within the main compound area (chemical storage area / firefighting system etc.).

As outlined within the preliminary Conceptual Site Model (CSM), ERM considered there may be a potential risk to human health and / or ecological receptors due to a number of potentially complete pollutant linkages identified by the PSI. Further investigation was therefore considered to be required to assess the potential risk to human health and sensitive ecological receptors.

- ERM recommended that a DSI should be undertaken to assess the contamination status of the Aerotropolis core (including the Site), to further characterise volumes of fill materials i that may require management and / or remediation and aid in the planning for future development works (offsite disposal, site management requirements etc.).

ERM noted that the DSI should be undertaken in consideration of previous investigations undertaken within and the identified CoPCs and include an assessment of soil, sediment, surface water and groundwater.

Based on the outcomes of the PSI, including the review of previous investigations, previous approved remediation plans and Site Audit Statements, it was considered that the Site could be made suitable for the proposed development following further investigations and completion of any subsequent required remedial / site management works.

DRAFT

ERM (2021a) TSI

ERM was engaged by WPCA to undertake a Targeted Site Investigation (TSI) of certain portions of the Site. This targeted investigation was undertaken specifically to further the understanding of potential key constraints to future development works, and to enable collection of additional data to supplement existing information relating PFAS throughout Site and potential uncontrolled filling within a portion of Moore Gully

To achieve the above objectives, ERM undertook a TSI including the completion of a Ground Penetrating Radar (GPR) survey and test pitting within Moore Gully, and targeted soil, sediment and water sampling. The targeted sampling included the completion of shallow soil bores within overland flow paths located downgradient of the central compound area, installation of monitoring wells located on the periphery of the central compound area and the collection of surface water / sediment samples from offsite surface waters located adjacent to the Site.

Results of this investigation indicated the following:

- During investigation works, fill materials were generally observed to be comprised of brown – dark brown top soil materials containing a range of organic materials (roots etc.) to a maximum depth of 1.0 m below ground level (bgl) within Moore Gully and 0.2 – 0.5 m bgl within the central and eastern portions of the Site;
    - PID measurements collected during soil investigation works returned concentrations ranging from 0 – 1.7 parts per million by volume (ppm v) which were considered consistent with background conditions and not indicative of potential anthropogenic volatile contamination;
    - ERM noted that isolated anthropogenic inclusions (trace plastics etc.) were identified within fill materials encountered during excavations undertaken within Moore Gully;
    - During soil investigation works, no evidence of asbestos Containing Materials (ACM) or other indicators of significant / widespread anthropogenic wastes were identified within the advanced test pits or soils bores;
- Natural materials were typically encountered at depths of 1.0 m bgl and comprised sandy silty clay (red brown, medium firm / medium plasticity) to the maximum depth of test pit excavation (2.0 m bgl) overlying natural shales to the maximum depth of investigation works (20.5 m bgl);
- Groundwater was identified at depths ranging from 5.545 m btoc (MW206) to 12.111 m btoc (MW202); and
- Surface water and sediment sampling indicated low levels of water present within adjacent accessible drainage lines. Where surface water was present field observations did not identify sheen / odour or other visual / olfactory indicators of anthropogenic contamination. Sediments were noted to be generally comprised of silty / sandy materials free from visual / olfactory indicators of anthropogenic contamination.

Laboratory analysis of collected samples returned concentrations of CoPCs less than LOR and or the adopted assessment screening values with the exception of the following:

- PFAS exceeding the adopted low density residential screening values within surface soils located on the eastern boundary of the site compound / TfNSW site (BH211); and
- Laboratory analysis of collected surface water / sediment samples returned concentrations less than the adopted assessment screening values with the exception of surface water sample SW-3 which exceeded the adopted 99% freshwater ecological screening value for PFOS (0.00002 ug/l).

ERM (2021b) SAQP

ERM was engaged by WPCA to prepare a Sampling and Analysis Quality Plan (SAQP) for the Site. The SAQP described the Data Quality Objectives (DQOs) and required investigation methodology for undertaking this DSI including sampling, analytical and reporting requirements.

DRAFT

3.1 Summary of Previously Identified Contamination

The following table summarises the occurrence and extent of contamination identified within the previous investigations reviewed and completed by ERM.

Table 3.1 Summary of Previously Identified Contamination

Location	Area of Environmental Concern	Comment
Onsite – First Building Area	**Unexpected finds / buried waste / fill materials**	■ While previous investigations have been undertaken within the portion of the Site identified as Moore Gully, due to limitations with GPR surveys the potential for buried wastes still remains a potential concern. ■ ERM notes the potential for additional fill materials to have been located within Moore Gully or other burial areas located within the Site. ■ This area may require further assessment to assess the potential for site management / remediation requirements prior to the commencement of development.
	Potential Weed Spraying and General Site Area	■ Potential historical land uses may have included weed spraying and other land uses to control weeds / pests within the Site. ■ Concentrations of PFAS (PFOS + PFHxS) in surface soils have been identified at low concentration at various locations throughout the surrounding area and may be associated with surface run off from the surrounding central compound area. ■ Potential nutrients may have been introduced to the Site as a results of historical agricultural activities.
	Asbestos service pits / conduits:	■ Onsite service pits / conduits require a survey to be completed to assess the potential for additional asbestos to be present which may require management and / or remediation to enable the Site to be suitable for the future proposed development.
Offsite (but within remainder of WPCA Land)	**Central Compound Fuel storage:**	■ Groundwater monitoring undertaken to date has not identified elevated hydrocarbons within groundwater wells located within the vicinity of existing USTs. ■ Reports indicate that fuel tanks still contain diesel / petrol products with the last investigation undertaken in 2011. ■ There is the potential for leaks of fuels to have occurred within the intervening period as tanks are unlikely to have been maintained during this period or assessed for loss / leaks. ■ Fill materials adjacent to USTs identified to be stained (green colouring) and containing hydrocarbon odours.
	Central Compound Hazardous building materials:	■ Hazardous materials identified within building structures require removal / management and may have impacted localised surrounding surface soils (through degrading materials) ■ Where buildings are to be demolished, removal of hazardous building materials as per relevant regulatory requirements (including validation of surrounding surface soils). Validation of successful removal and confirmation that additional impact to surface soils did not occur during removal works; and

DRAFT

Location	Area of Environmental Concern	Comment
		■ Where buildings are to be retained, removal and / or management of identified hazardous materials as per relevant guidelines / standards. Where materials are to remain onsite, update and maintain hazardous materials register for all future users. Validation of surrounding soils may also be required to demonstrate suitability for the proposed development.
	Central Compound Septic tank	■ Previous investigation identified the presence of a septic tank within the central compound. While ERM notes that results from previous investigations did not identify concentrations of CoPCs to exceed screening values, as the septic tank was not targeted during investigation works, the potential exists for contamination of surrounding soils etc. to have occurred.
	Married Quarters - Identified asbestos surface impact	■ Previous investigations identified surficial asbestos within the vicinity of the former married quarters. ■ The identified asbestos impact may differ from distribution within Golder investigation. Potential for additional impact from degrading building structures etc. Fill was observed to 0.5 m bgl therefore potential exists for deeper asbestos materials to be present.
	Identified asbestos impacted stockpile:	■ Approximately 1600 m^3 of asbestos impacted fill has been identified within a stockpile located south of the administration building.
	Adjacent Residential Dwellings	■ ERM notes that residential blocks located adjacent to the Site were not inspected during works. ■ The potential exists for contamination associated with residential land uses such as weed spraying, pesticides, fertilisers, septic tanks, etc., minor vehicle maintenance activities and degrading hazardous building materials (asbestos, lead paints etc). ■ This area may require further assessment to assess the potential for site management / remediation requirements prior to the commencement of development.

DRAFT

4. DATA QUALITY OBJECTIVES

Based on the preliminary CSM presented within Section 5 of the ERM (2021b) SAQP, the following Data Quality Objectives (DQOs) were developed for this investigation.

The Data Quality Objectives (DQOs) for this SAQP have been developed in accordance with the ASC NEPM and the Australian Standard *AS4482 Guide to the Sampling and Investigation of Potentially Contaminated Soil*

4.1 Step 1 – State the Problem

The ERM (2021) PSI identified a range of potentially contaminating historical land uses / activities in the Site and surrounding area, as such WPCA required this DSI to be undertaken to assess the potential for contamination to be present that may require consideration prior to or during redevelopment works.

4.2 Step 2 – Identify the Decisions

Based upon the objectives of the DSI, the decisions required to meet the objectives of this DSI are discussed below:

- Are there any potential unacceptable risks to human health and / or ecological receptors from contaminants in surface water / sediments / fill / soil and / or groundwater?
- Is there any evidence of, or potential for, migration of contaminants from the Site?
- Is there any evidence of, or potential for, off-site migration of contaminants from adjacent sites onto the Site?
- Is there sufficient information on the distribution and characteristics of contaminated media across the site to evaluate risk of harm to human health and/or the environment and whether off-site migration of contamination may have occurred?
- Is management or remediation of contamination, if identified, required?
- Is there sufficient information on the distribution and characteristics of contaminated media across the Site to develop a Remediation Action Plan or Site Management Plan to (where necessary) remediate and / or manage site contamination?

4.3 Step 3 – Identify Information Inputs

The inputs to make the above decisions include:

- Information relating to the environmental setting of the Site and surrounding area obtained during preparation of the ERM (2021) PSI;
- Information obtained during review of previous investigations;
- Field observations made during intrusive investigation works;
- Laboratory analytical data of collected soil and groundwater samples;
- Field measurements collected during intrusive investigation and groundwater monitoring rounds;
- Screening-level assessment values from guidelines made or approved by the NSW EPA detailed within Section 6; and
- Confirmation of acceptable data quality by assessment of data quality assurance / quality control by comparison against Data Quality Indicators (DQI).

DRAFT

4.4 Step 4 – Define the Study Boundaries

The boundaries of the investigation are identified as follows:

- Spatial boundaries – the investigation is limited to the Site boundaries as illustrated within Figure 1 and the maximum depth of investigation at each location detailed within Section 5 of this report.
- Temporal boundaries – the temporal boundary is limited to the data collected during the completed investigation works. As such, seasonality was not assessed at this stage of the investigation.
- Constraints within the study boundaries – the following were limitations that required consideration within the development and implementation of the sampling strategy:
  - Access restrictions due to overlap with Sydney Metro works area boundary and access roads (refer **Figure 2**);
  - Access restrictions associated with construction activities within the northern portion of the Site;
  - Access restrictions associated with heritage items, site topography (gullies / drainages lines) and vegetation; and
  - The presence of underground and overhead utilities.

Sampling locations were identified within the ERM (2021b) SAQP in consideration of the above factors with some slight modification during investigation works as required to account for encountered site conditions.

4.5 Step 5 – Develop the Decision Rules

The decision rules adopted for this investigation are included in the table below:

Table 4.1 Data Quality Objectives – Decision Rules

Decision Required to be Made	Decision Rule
Is the data sufficient to address the objectives of the investigation?	■ Does the collected data indicate the potential for significant and widespread contamination arising from sources subject to this investigation? ■ Do field observations (including visual, olfactory, presence of anthropogenic materials in fill) indicate potential significant contamination at the investigation locations? ■ Do analytical data exceed adopted screening-level assessment values? ■ Is there sufficient information to estimate the volume of fill material contained onsite? ■ Have any additional areas of potential environmental concern been identified within investigations works?
Is the data generated by sampling and analysis of an acceptable quality?	■ Has the data collected been subjected to an assessment of quality assurance/quality control and found to be suitable for use in this assessment?
Does the Site contain soil / groundwater and surface water / sediment impacted by contamination resulting from historical land uses?	■ Collected soil and groundwater samples are to be analysed for CoPCs associated with current and historical land uses practices and results compared to relevant NSW EPA made or endorsed regulatory screening values. Where necessary, appropriate statistical analysis will be used to further analyse data and inform site assessment.
Is there evidence of significant widespread contamination?	■ Collection of representative soil and groundwater samples during site investigation works.

DRAFT

Decision Required to be Made	Decision Rule
Is additional information required to determine the potential liabilities/constraints associated with the proposed development?	■ Where determined that additional information was required to further reduce the uncertainties associated with the distribution and characterisation of soil and / or groundwater contamination, then appropriate recommendations for further assessment and/or investigation (including for assessment of potential risks) have been provided.
Is there sufficient information to develop a remedial / site management strategy	■ Do the results of the investigation provide sufficient information of the nature, distribution and risk to identified receptors of contamination within soil and groundwater? If no, additional investigation may be required.

4.6 Step 6 – Specify Limits of Decision Error

This step establishes the decision maker's tolerable limits on decision errors, which provide performance goals for limiting uncertainty in the data. Data generated during this project must be appropriate to allow decisions to be made with confidence.

Specific limits for this project have been adopted in accordance with the appropriate guidance from the HEPA (2020) NEMP and the ASC NEPM appropriate data quality indicators (DQIs) used to assess data quality assurance / quality control (QA / QC) and standard ERM procedures for field sampling and sample handling.

To assess the usability of the data prior to making decisions, the data was assessed against pre-determined DQIs for precision, accuracy, representativeness, comparability and completeness.

The pre-determined DQIs established for the project are discussed below in relation to precision, accuracy, representativeness, comparability, completeness and sensitivity.

- **Precision** – measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** – measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this project is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** – expresses the degree with which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the site, and by using an adequate number of sample locations to characterise the site to the required accuracy.
- **Comparability** – expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in sampling techniques, analytical techniques and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** – expresses the appropriateness of the chosen laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted screening values.

DRAFT

Where any of the DQIs were not met, further assessment was conducted as necessary to assess whether the non-conformance significantly affects the usefulness of the data. Potential corrective actions include requesting further information from samplers and/or analytical laboratories, downgrading of the quality of the data or alternatively, re-collection of the data. DQIs are provided the table below.

Table 4.2 Data Quality Objectives – Limits of Decision Error

Data Quality Objectives	Frequency	Data Quality Indicator
Precision		
Blind duplicates (intra laboratory)	■ 1/20 samples (or 1/10 for PFAS)	■ <30% RPD where result is >10 times LOR
Blind duplicates (inter laboratory)	■ 1/20 samples (or 1/10 for PFAS)	■ <30% RPD where result is >10 times LOR
Accuracy		
Surrogate spikes	■ All organic samples	■ 70-130%
Laboratory control samples	■ 1 per lab batch	■ 70-130%
Matrix spikes	■ 1 per lab batch	■ 70-130% ■ Lower recoveries may be acceptable for organochlorine pesticides (OCPs), organophosphate pesticides (OPPs), (polychlorinated biphenyls) PCBs and phenols and, where necessary, were assessed according to USEPA protocols.
Representativeness		
Sampling appropriate for media and analytes	■ NA	■ NA
Samples extracted and analysed within holding times.	■ NA	■ organics (14 days), inorganics (6 months)
Rinsate blank	■ 1 per day where non-dedicated equipment is used. ■ Samples are to be analysed for all CoPCs other than asbestos.	■ <LOR
Trip spike	■ 1 per lab batch (BTEX only)	■ 70-130%
Method blank / field blank	■ 1 per lab batch	■ <LOR
Comparability		
ERM standard operating procedures for sample collection & handling	■ All samples	■ All samples
NATA* accredited analytical methods used for all analyses	■ All samples	■ All samples
Consistent field conditions, sampling staff and laboratory analysis	■ All samples	■ All samples

DRAFT

Data Quality Objectives	Frequency	Data Quality Indicator
Completeness		
Sample description and Chain of Custodies completed and appropriate	■ All samples	■ All samples
Appropriate documentation	■ All samples	■ All samples
Satisfactory frequency and result for QC samples	■ All QA / QC samples	■ -
Data from critical samples is considered valid	■ NA	■ Critical samples valid
Sensitivity		
Limits of reporting appropriate and consistent	■ All samples	■ All samples

4.7 Step 7 – Optimise the Design for Obtaining Data

Historic uses of the Site and immediately surrounding area indicate the potential for contamination to be present that may pose a risk to human health or the environment. The potentially contaminating sources and activities undertaken are detailed above.

Various strategies for developing a statistically based sampling plan are identified in the ASC NEPM including judgemental; random; systematic and stratified sampling patterns.

Where there is sufficient information to suggest that an area is a source and where existing laboratory confirmatory data are available, then additional soil characterisation may not be warranted. The focus of the data collection was towards understanding and quantifying any complete pathways that may require further management.

While ERM notes that the sampling density adopted was less than the density detailed within the NSW Sampling Density guidance, based on the below approach, the proposed sampling density (~57 m grid) enabled identification of a hotspot with 30 m radius with 95% confidence (as detailed below).

The sampling rationale / strategy adopted is described in the table below and sample locations are presented on **Figure 4**.

Table 4.3 Data Quality Objectives – Optimise the Design for Obtaining Data

Media	Sample Location	Sampling Rationale
Soil	Test Pits	■ Test pits were excavated in a grid based approach within areas of open space and portions of the site in accordance with the NSW EPA sampling density requirements ■ The purpose of test-pit sampling was to visually assess the potential composition and extent of fill materials / potential asbestos within accessible portions of the Site and to enable sample collection. ■ Visual observations were recorded for all excavated test pits with soil samples obtained to assess potential site management requirements during construction and to aid in determining potential future waste classification requirements. ■ The density of test pits was estimated on a systematic triangular grid based approach with the ability to detect a circular hotspot of approximately 30 m radius with 95% confidence (calculated using Visual Sample Plan software developed by United States department of Energy). Based on the estimated large block / development approach proposed for the site, this sampling design is considered appropriate.

DRAFT

Media	Sample Location	Sampling Rationale
	Soil Bores	■ Where site conditions precluded test pits, soil bores were utilised to assess ground conditions – 42 sample points were converted to soil bores. ■ While ERM notes that soil bores are not the preferred method for assessing the potential for asbestos, key indicators such as depth of fill and other signs of anthropogenic inclusions can be used as indicators for potential asbestos.
Groundwater	Groundwater Monitoring Wells	■ Based on a review of site history, it is the opinion of ERM that the potential for underground storage of fuels or onsite chemical storage is low, the potential for onsite migration of groundwater contamination required consideration. ■ A total of 11 additional groundwater monitoring wells were installed. Six wells were installed in a general grid based approach within the southern portion of the Site, two within the north western portion of the Site and three within the eastern portion of the Site to assess groundwater conditions and potential for on and off-site migration.
Surface Water / Sediments		■ Due to the potential re-use of surface water within the Site and broader Aerotropolis Core for recreational uses, sediment samples were collected from drainage lines that flow onto and within the site to aid in the assessment of potential for re-use requirements. ■ Surface water / sediment samples were collected opportunistically from onsite drainage lines to assess the potential for migration of PFAS and other key CoPCs from adjacent sites. ■ ERM notes that data collected during this investigation was used to supplement existing data relating to potential surface water / sediment contamination. Where possible, surface water and sediment samples were collected from locations consistent with previous investigation to allow comparison of potential trends to be assessed.

DRAFT

5. INVESTIGATION METHODOLOGY

The following table summarises the scope of works and methodology completed as part of this assessment. Fieldwork works were undertaken by suitably qualified ERM environmental scientists in general accordance with the requirements outlined within the ERM SAQP (ERM 2021b).

A summary of completed works is presented within the table below.

Table 5.1 Investigation Methodology

Task	Proposed Scope
1 – Project Preliminaries	Prior to the commencement of investigation works, ERM completed the following: ■ Preparation of a site specific Health and Safety Plan (HASP) and associated Safe Work Method Statements (SWMS). ERM notes that in addition to ERM / regulatory requirements, the HaSP and SWMS considered all NSW Government advice relating to onsite precautions for COVID-19. ■ Preparation and submission of required permits for the investigation works.
2 – Service Location	■ Prior to the commencement of intrusive works, ERM undertook a review of available service plans, including Dial before You Dig and client supplied site plans. ■ The proposed investigation locations were cleared via an experienced underground utility locator with radio detection and Ground Penetrating Radar (GPR) equipment.
3 – Vegetation Clearance and Heritage Areas	■ To facilitate sampling of all required investigation locations, ERM worked with WPCA to ensure vegetation clearance works occurred within portions of the site where access was restricted due to vegetation growth. ■ Vegetation was cleared utilising either a back-hoe or tractor mounted slasher with specialist vegetation clearance attachments. ■ Following an assessment of the site by a dedicated heritage team, it was determined that a number of areas containing potentially significant heritage finds were present across the site. In order to reduce the likelihood of disrupting potentially significant heritage finds, ERM did not conduct intrusive sampling works within these areas. As a result, a total of 28 planned soil sampling locations were removed from the scope of works.
4 – Equipment Calibration	All equipment used in the field was operated under the appropriate technical procedures and calibrated prior to use in accordance with the manufacturer's specifications. ■ The PID was calibrated to an isobutylene standard at the beginning of each working day in accordance with manufacturer requirements and ERM's SOPs. ■ Water quality meters were calibrated by the rental company prior to use and relevant calibration certificates retained by ERM (**Appendix E**). ■ All of the relevant calibration records will be provided as an annex in the investigation report (refer to **Appendix E**). ■ Oil /water Interface probes were calibrated by the rental company prior to use and relevant calibration certificates retained by ERM (**Appendix E**).
5 – Test Pitting	Test pitting was undertaken to assess potential uncontrolled fill materials within the Site to aid in determining potential management / remediation requirements during construction and inform potential waste classification requirements. ■ A total of 248 test pits were excavated to a maximum depth of 2.0 m bgl or the occurrence of natural materials (whichever was encountered first) with a backhoe / excavator in generally triangular grid based approach across the Site (**Figure 4**). Where possible, two samples were collected from each location (one of fill and one of underlying natural soils) and assessed for relevant CoPCs. ■ Soils were logged by an appropriately trained and experienced scientist/engineer to record the following information: soil/rock type, colour, grain size, sorting, angularity, inclusions, moisture condition, structure, visual

DRAFT

Task	Proposed Scope
	signs of contamination (including staining and fragments of fibre cement sheeting) and odour in general accordance with AS 1726. ■ Two primary samples (one topsoil / fill and one natural) were collected and analysed from each sampling location for chemical analysis as per the requirements of the ERM (July 2021) SAQP. ■ Field quality control/quality assurance (QA/QC) samples were collected including field duplicates, inter-laboratory duplicates, rinsate blanks, trip blanks and trip spikes (as per the requirements detailed within the SAQP); ■ During the advancement of all test pits all locations were field screened with a calibrated photoionisation detector (PID) for the presence of ionisable volatile compounds. ■ All samples collected were placed within laboratory-supplied containers / sample bags, stored in a chilled esky and transported to a NATA accredited laboratory under chain of custody conditions for the required analysis. Duplicate and Triplicate spilt samples were collected as per the requirements outlined within the NEPM. Copies of CoCs are provided within **Appendix F.** ■ All test pit locations were recorded using a handheld Global Positioning System (GPS) device for incorporation into subsequent reporting ■ Test pits were re-instated with excavated materials in the order from which they were excavated and track rolled for compaction.
6 – Soil Bores	A total of 42 soil bores were undertaken within the Site to a maximum depth of 0.5 m bgl within locations either previously test pitted or inaccessible to mobile plant (**Figure 4**). ■ Soil bores were logged by an appropriately trained and experienced scientist/engineer to record the following information: soil type, colour, grain size, sorting, angularity, inclusions, moisture condition, structure, visual signs of contamination (including staining and fragments of fibre cement sheeting) and odour in general accordance with AS 1726. ■ Two primary samples (one fill and one natural) were collected and analysed from each location for chemical analysis as per the requirements of the ERM (2021) SAQP. ■ Field quality control/quality assurance (QA/QC) samples were collected including field duplicates, inter-laboratory duplicates, rinsate blanks, trip blanks and trip spikes (as per the requirements detailed above within Table 4.2); ■ During the advancement of all soil bores all locations were field screened with a calibrated photoionisation detector (PID) for the presence of ionisable volatile compounds. ■ All locations were GPS recorded for incorporation into subsequent reporting. ■ All collected samples were placed within laboratory-supplied containers, stored in a chilled esky and transported to a NATA accredited laboratory analysis under chain of custody conditions for the required analysis. Copies of CoCs are provided within **Appendix F.**
7 - Groundwater Well Installation	A total of 11 groundwater monitoring wells were installed to provide general site coverage to assess potential impact to underlying aquifers and any associated risk to identified receptors associated with historical land use practices undertaken within the Site and surrounding area (**Figure 4**). ■ Groundwater monitoring wells were advanced using various drilling methods including hand augering, push tubing and air hammering based on depth of well to be installed, access and type of samples to be collected. ■ Monitoring wells were installed to depths ranging from 5 m bgl to 21.5 m bgl. ■ During the drilling of groundwater bores, all locations were field screened with a calibrated photoionisation detector (PID) for the presence of ionisable volatile compounds. ■ Groundwater monitoring wells were constructed using 50 mm machine slotted uPVC casing, washed filter sand and a bentonite clay seal. The screened interval installed a minimum 3.0 m in length, with longer screened sections installed in locations where signs of water were faint to ensure water in wells. ■ After the installation, each groundwater monitoring well was developed. During development, wells were purged using high flow pumps and / or disposable bailers.

DRAFT

Task	Proposed Scope
	■ Upon completion of drilling works, waste materials generated during drilling works were temporarily stored in sealed drums in an area deemed suitable by WPCA and disposed offsite by a licensed waste contractor. ■ All wells were surveyed to aid in the assessment of ground water flow direction / velocity.
8 - Groundwater Sampling	ERM undertook a groundwater-monitoring event (GME) of 11 of the newly installed groundwater wells located within the Site on the 9th February 2022. ■ The standing water levels in each groundwater monitoring wells were gauged using an oil/water interface meter from the top of the well casing. ■ Total depth of the groundwater monitoring well were measured. ■ Groundwater within the wells was purged and sampled using Hydrasleeve sampling methods and placed into laboratory provided sample containers and stored with a cooler box for transport to the laboratory under Chain-of-Custody procedures. ■ Samples were collected and stored in appropriately preserved laboratory supplied containers for a suite of analytes as per the ERM (2021b) SAQP. ■ The samples were submitted to NATA accredited analytical laboratory for analysis in accordance with the proposed analytical schedule. Duplicate and Triplicate split samples were collected as per the requirements outlined within the NEPM.
9 – Surface Water and Sediment Sampling	■ ERM collected 9 surface water samples either directly into the sampling containers or using a hand-held sampling device (Swing Sampler) with subsequent decanting into the laboratory provided sampling containers. ■ Samples were collected to minimise disturbance to sediment to avoid excess sediment load in the sample, this included collection of surface water sample at a given location, prior to the sediment sample being collected. ■ Samples were collected from the middle of the water column present where practical. Sampling depths were recorded at each location as the depths vary depending on the season and location. ■ Sediment and surface water sample locations were co-located with water samples collected first to avoid cross contamination from disturbed sediments. In locations where surface water was not present during sampling, only sediment samples were collected. ■ ERM collected a total of 10 sediment samples from areas identified as drainage lines and / or overland flow paths (**Figure 4**). ■ Where grass, reed or vegetation growth covered the sediment, this material was moved aside using hand tools, with sediment samples collected from directly underneath the vegetation layer (i.e. at 0-0.1 m bgl from the sediment layer). ■ Where needed, sediment samples were placed in a sediment tray to allow excess water to be drained off, prior to transfer of sample into the laboratory supplied jar. ■ Samples were collected using gloved hand grab samples. Sediment was then transferred into sample jars using disposable nitrile gloves. ■ Sediment samples were collected via nitrile gloved hand and placed directly into laboratory suppled containers and submitted to NATA accredited analytical laboratory for analysis in accordance with the proposed analytical schedule. Duplicate and Triplicate split samples were collected as per the requirements outlined within the NEPM.
10 - Equipment Decontamination	■ All sampling equipment was decontaminated between sampling locations where designated disposable materials were not used. ■ Rinsate samples were collected as per the requirements of the SAQP to confirm the appropriateness of equipment decontamination.
11 - Waste Materials	■ Waste materials generated from sampling works were collected and stored in appropriately labelled dedicated storage containers. At the time of this report, waste remains stored onsite and will be disposed of appropriately following conclusions of environmental works for the Site. Disposal documentation will be provided as an addenda to this report.

DRAFT

5.1 SAQP Non-Conformances

ERM notes the following overall minor non-conformances with the ERM (2021) SAQP.

Table 5.2 SAQP Non-Conformances

Item	Reason For Non-Conformance	Comment
Additional Soil Bores	■ ERM notes that due to site access issues centred on the overly soft surface materials present along much of the low lying, flood-prone areas of the site, some areas were only accessible by foot. In such instances soil bores were advance manually using a hand auger in place of a test pit.	■ It is noted that field observations and test pit logs from the initial test pitting works confirming the depth and nature of fill materials (including the potential for asbestos to be present) were recorded and as such this minor modification to the scope is not considered to have affected the overall quality of the collected data set.
Surface water samples not collected	■ ERM notes that during the course of the investigation works, no surface water was observed at location SW9, hence no sample was collected from this location.	■ Sediment samples were collected from onsite drainage lines / overland flow paths. The use of sediment data is considered to be a good indicator of potential impact arising from surface water flows within the site during periods of high rainfall, hence the absence of surface water from this location is not considered an issue.
Variance in test pit and monitoring well locations	■ ERM notes that test pit locations in the SAQP were based on a grid based layout. Given the size of the site, the lack of visible land marks in some areas and limitations in accuracy of hand held GPS units some minor deviation from the initially planned grid was noted. Completed locations (as shown on **Figure 4**) are based on onsite hand held GPS data and reflect the recorded placement of sampling locations. ■ Some locations were moved due to accessibility issues in the low-lying, flood prone areas of the Site. ■ Areas determined to contain potentially significant heritage finds were avoided, leading to the cancellation of 28 planned test-pit locations (refer to **Figure 4**).	■ While ERM notes there is minor deviation from the initially proposed grid within the SAQP, the overall sampling plan achieved the required coverage and general sampling density as detailed within the SAQP. As such it is the opinion of ERM that the placement of sample locations as detailed within **Figure 4** does not materially alter the suitability of the collected data set in meeting the stated project objectives nor the outcomes of the report.
Test pit locations within the Sydney Metro Licenced area (AI_TP145 and AI_TP152)	■ As above, some locations varied from the SAQP due to the size of the site and lack of visual land marks. ■ Metro area boundaries were altered in the time between the time test pitting occurred and the writing of this DSI, resulting	■ The sampling locations AI_TP145 and AI_TP152 have been completed within the Sydney Metro exclusion zone, which is not covered as part of this investigation. Due to a variation of boundaries after works had begun it was not foreseeable that these locations would be outside of the Site. The locations are not within areas that represent significantly different site conditions and are therefore considered to be representative of the general area, as such the data from these locations can still be used in the assessment of the site which is part of this investigation.

DRAFT

6. ADOPTED SCREENING VALUES

6.1 Soil and Groundwater Screening Values

Individual soil and groundwater data, along with the maximum, minimum, mean, standard deviation and 95% Upper Confidence Limit (UCL) of the mean concentration (if required) were generally compared to the adopted screening values.

The adopted screening values have generally been sourced from guidelines made or approved by the NSW EPA which includes the National Environmental Protection Council (NEPC) (1999) National Environment Protection (Assessment of Site Contamination) as amended by Amendment Measure 2013 (No. 1) and where alternative sources have been utilised appropriate justification has been provided.

To provide flexibility for final master planning, screening values protective of all permissible uses as per the land zoning were adopted for initial screening purposes.

Table 6.1 Soil and Groundwater Screening Values

Media	Screening Values
Soil	Human Health Soil contaminant concentrations have been compared to published values consistent with requirements in NEPM, 2013 sourced from the following: ■ **Health Investigation Levels** (HILs): ▪ HIL A (low density residential) ▪ HIL C (recreational) ▪ HIL D (commercial / industrial). ■ **Health Screening Levels (**HSLs) for vapour intrusion: ▪ HSL A (low density residential) ▪ HSL C (recreational) ▪ HSL D (commercial / industrial). ■ **Ecological Investigation Limits** ▪ Commercial and industrial land use (Ecological – Direct Contact) Coarse ▪ Urban residential and open space – coarse Management Limits ■ Management Limits for assessment of risks to human health in residential, parkland and public open space as well as commercial and industrial settings were applied subsequent to the above screening values. Aesthetic ■ Consideration was also given to the aesthetics of the soil encountered.
Groundwater	For the purpose of this assessment, groundwater concentrations of contaminants were compared to published values consistent with requirements in NEPM, 2013 sourced from the following in the specified order of preference: ■ Health Screening Levels (HSLs) for vapour intrusion, asper the NEPM, 2013: ▪ HSL A (low density residential) ▪ HSL C (recreational) ▪ HSL D (commercial / industrial). ■ National Health and Medical Research Council (2011) Australian Drinking Water Guidelines (updated August 2018). While groundwater is considered unlikely to be used for drinking purposes in the vicinity of the site, screening against drinking water guideline values was conducted on a conservative basis under the scenario that groundwater is extracted and used for other purposes. Screening against drinking water guideline values has also been conducted on a conservative basis under the scenario that groundwater has the potential to discharge to a surface water body which could be used for recreational purposes. ■ Australian and New Zealand Environment Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ),

DRAFT

	Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC & ARMCANZ, 2000). On the basis that the most likely nearest potential surface water receptor is a fresh water body, Trigger Values for fresh water and 95% protection levels (unless otherwise noted) have been adopted. Comparison against these screening values is considered conservative as some attenuation of chemical constituents would be expected prior to groundwater at the site reaching the nearest potential surface water receptors.

6.2 PFAS Specific Screening Values

6.2.1 Soil Screening Values

The adopted screening values relevant to the different potential exposure scenarios are detailed in the following table.

Table 6.2 PFAS Specific Soil Screening Values

Land use Scenario	Source and Rationale		
	PFOS and/or PFHxS	PFOA	Comment
Health Based Guidance Values			
Public open space	1 mg/kg	10 mg/kg	■ For site areas where recreational use may be undertaken the public open space guidance were utilised. ■ Based on 20% of FSANZ TDI, i.e. up to 80% of exposure is assumed to come from other pathways. National Environment Protection (Assessment of Site Contamination) Measure Health Investigation Level C assumptions for public open space such as parks, playgrounds, playing fields (e.g. ovals), secondary schools (except where soil used for agriculture studies) and footpaths. ■ It does not include undeveloped public open space (such as urban bushland and reserves) which should be subject to a site-specific assessment where appropriate.
Residential with garden / accessible soil	0.01 mg/kg	0.1 mg/kg	■ ERM notes that the final site layout is not finalised and as such soil results were screened against residential with garden accessible soil. The use of this screening value is considered conservative and appropriate. Where site land use / masterplans can be provided that exclude low density dwellings, alterative screening values may be adopted based on the proposed land-use. ■ Based on 20% of FSANZ TDI, i.e. up to 80% of exposure is assumed to come from other pathways. ASC NEPM Level - A assumptions with home-grown produce providing up to 10% of fruit and vegetable intake (no poultry), also includes children's day care centres, pre-schools and primary schools. Does not include home-grown poultry/egg.
Industrial/ commercial	20 mg/kg	50 mg/kg	■ Assumes 8 hours is spent indoors and 1 hour spent outdoors at a site such as a shop, office, factory or industrial site. If the typical exposure for a site is predominantly outdoors with significant earthen areas, recalculation of a site-specific value is recommended. These were derived using the methodology consistent with assumptions set out in the ASC NEPM for HIL D.

DRAFT

Land use Scenario	Source and Rationale		
	PFOS and/or PFHxS	PFOA	Comment
Ecological Guideline Values			
Ecological direct exposure	1 mg/kg	10 mg/kg	■ Soil results collected from the Site was assessed against the ecological direct exposure screening values presented in NEMP (2020). ■ The NEPM states that 'future work is recommended to review available soil – ecological direct exposure criteria proposed by Australian research and industry organisations. As an interim, it is proposed that the human health screening value for Public open space be used.'
Ecological indirect exposure	0.01 mg/kg	NA	■ Soil results collected from the Site will be assessed against the interim soil – ecological indirect exposure presented in NEMP (2020). ■ ERM notes that the indirect guidelines are likely to be overly conservative for the Site and has been considered in a site-specific during analysis and evaluation of data.

6.2.2 Sediment Screening Values

There are no published health or ecological screening values for PFAS in sediment. The primary issues of concern associated with PFAS in sediment are as follows.

- Potential human health impacts due to direct contact exposure to sediment;
- The potential for sediment to act as a source of PFAS that may remobilise into the water column and/or aquatic food chains; and
- The potential for sediment and / or sediment pore water concentrations to pose direct eco-toxicological effects.

In consideration of the primary risks / exposure scenarios, the following tier 1 screening values have been adopted.

- Health-based screening values for open space and residential soil (NEMP 2020) have been adopted to assess potential health risks due to direct contact with sediment by human receptors.
  - ERM notes that while soil screening values are not derived with specific consideration of sediment exposure, the frequency and duration of exposure to sediments during recreational use of water bodies are much lower than those assumed for soil exposure in a residential setting. Use of residential soil screening values is therefore considered protective of potential risk due to sediment exposure.
- Interim Soil – ecological direct exposure (NEMP 2020) have been used to assess the sediments.
  - ERM notes that while the soil screening values have not been derived with specific consideration of sediment exposure the use of the guideline for screening purposes in conjunction with the surface water sampling is considered appropriate for the investigation
- Potential impacts on surface water and/or the aquatic food chain have been assessed by comparison of surface water concentrations to relevant screening levels.
- There is currently insufficient data regarding direct sediment toxicity to sediment dwelling organisms, thus no screening values are available for this pathway.
  - As an interim measure the NEMP recommends the human health value of 1 mg/kg be used to evaluate soil and this has been used to evaluate provide an indication the exposure of organisms to concentrations in sediment.

DRAFT

6.2.3 Groundwater Screening Values

- While ERM notes that an initial assessment of potential beneficial re-uses of groundwater within the area **(**Section 2.2**)** indicates that the beneficial use of groundwater for potable use within the vicinity of the Site is unlikely, as a conservative measure, drinking water guidelines were used as the primary tier 1 human health screening values for this assessment. Details on screening values for surface and groundwater were adopted as per the below table.

Table 6.3 PFAS Specific Water Screening Values

Land use Scenario	Rationale and adopted Ground and Surface water Screening Values		
	PFOS / PFHxS	PFOA	
Ecological – Fresh Water	0.00023 µg/L (99% protection); 0.13 µg/L (95% protection); (PFOS only)	19 µg/L (99% protection); 220 µg/L (95% protection;	■ Groundwater and Surface water screening values are sourced from Table 1 Draft Commonwealth Environmental Management Guidance (2016) which summarises the draft (as yet unpublished) guideline values developed for inclusion in the future revision of the ANZECC&ARMCANZ (2000) document "*Australian and New Zealand Guidelines for Fresh and Marine Water Quality*". ■ These guidelines are derived for a range of species protection levels, depending on the nature of the aquatic ecosystem, with 99% species protection values applicable to high conservation value / largely unmodified systems, 95% protection values applicable to slightly to moderately disturbed systems, and lower protection levels (90% and/or 80%) applicable to highly disturbed systems. ■ In addition, ANZECC&ARMCANZ (2000) recommend that for bio accumulative compounds, the 99% level be used for slightly to moderately disturbed ecosystems, unless site-specific assessment of risks due to bioaccumulation through the food chain is undertaken.
Human Health – Drinking Water	0.07 µg/L (PFOS + PFHxS)	0.56 µg/L	■ Values adopted from FSANZ (2017) Health Based Guidance Values for PFAS: For use in site investigations in Australia. Also referenced in the NEPM (2020). ■ The recreational screening value has been sourced from the NHMRC 2019 guidance utilising refined estimates of water ingestion while swimming etc. ■ ERM notes that the degree of conservatism in the drinking water and recreational water guidance values (90% attributed to other exposure pathways) means that exceeding these values does not constitute a risk if other pathways are controlled.
Human health – Recreation	2 µg/L (PFOS + PFHxS)	10 µg/L	

ERM notes that due to the low concentrations associated with the NEMP freshwater screening values, where the LOR exceeded the adopted screening value for HEPA NEMP (2020) Ecological – Fresh Water 99% protection of species, the laboratory LOR was used as an interim screening value.

DRAFT

7. INVESTIGATION RESULTS

The following sections summarise the results of the investigation works undertaken by ERM.

7.1 Field Observations

7.1.1 Site Walkover

During the initial soil investigation works conducted by ERM between 25 October – 20 December 2021, the following observations were made. Site features observed during the Site walkover are presented within **Figure 4** and a photographic log presenting the observed conditions during investigation works is presented within **Appendix D;**

- Access roads were located within the Site boundary, including a bitumen road that entered the Site from the 1st building area in the north-west and running straight to the south along the western site boundary before turning east-west and terminating at the site compound in the centre of the Site (Photographs 39 and 39 in **Appendix D**). Other unsealed access roads were observed in the north-west, along the perimeter of most of the Site and cutting east-west through the centre of the site just south of the former compound building. Unsealed access roads were comprised either of exposed clays or topsoil with grass cover;
- The remainder of the Site was comprised of open grass areas (adjacent to roadways) or thicker shrubs / vegetation (Photographs 8, 11, 14, 15, 21, 22, 27, 29 and 34 in **Appendix D**). ERM notes that prior to sampling works, much of the site vegetation was cleared to enable access;
- Signage related to underground services was observed near the unsealed access roads within the north-western portion of the Site, indicating that services were running from the compound at the centre of the wider site to the site access point on Badgerys Creek Rd in the north-west. No signs of fill materials / foreign materials were observed across the site surface in this area. It is noted that advice from WPCA and the adjacent Transport for New South Wales (TfNSW) contractors indicated that all onsite services were redundant; and
- During completion of the site walkover soil bores and test pits, no evidence of ACM or anthropogenic inclusions (bricks, demolition rubble etc.) were noted with the exception of some broken glass / ceramic fragments within topsoil and shallow fill materials located in the former married quarters area and some minor bitumen inclusions noted within surface materials at location TP92 toward the south of the Site.

7.1.2 Soil Investigation Works

Figure 4 illustrates soil investigation locations. Bore logs detailing the stratigraphic conditions encountered during drilling of boreholes and test pitting works are presented in **Appendix C**. A photographic log illustrating conditions encountered during investigation works is presented within **Appendix D**.

Soil investigation works including the completion of 238 test pits over the periods 27 October – 9 November 2021, 17 December – 1 December 2021 and 16 June 2022 and 42 soil bores over the periods 15 – 16 November, 21 December 2021 and 16 June 2022. Soil investigation works were conducted to assess the conditions of soil materials throughout the Site and the presence, depth and extent of fill materials.

DRAFT

During test pitting works, fill materials were generally observed to extend to depths of approximately 0.1 – 0.2 m bgl (with the exception of TP92, which extended to 0.4 m) and comprised a mixture of orange, red and grey mottled clays and tan fine—coarse grained sand containing various foreign materials including bitumen, glass, metal wiring, ceramic and brick inclusions. During investigation works, no evidence of staining / odours were noted within fill materials. Observations of anthropogenic inclusions such as bitumen, glass, metal wiring, ceramic or brick in fill materials were limited to a few isolated locations near the northern side of the bitumen access road leading to the former site compound (TP144 and TP148), and an isolated location in the gully towards the south of the Site (TP92).

- **Figure 9 (Appendix A)** illustrates the estimated fill / topsoil thickness across the site based on field observations made during investigation works.

Natural materials were generally encountered at surface or at depths of between 0.1 and 0.2 m bgl in locations with identified overlying fill. Natural materials were generally comprised of brown and red clays with occasional grey / orange inclusions, varying in stiffness and plasticity to a depth of approximately 2.5 m bgl overlying fine-grained interbedded sandstone and shale bedrock with clay bands. Low-lying areas and site drainage lines were generally observed to contain dark grey fine silty clay topsoils overlying soft grey plastic clays. Occasional observations of charcoal within natural materials occurred across the Site. During investigation works, no evidence of staining / odours were identified within natural materials.

Field screening was undertaken using a PID during soil investigation works (including drilling works associated with groundwater well installation) and generally reported results ranging from 0 – 10 ppm v (noting all PID screening results presented are equivalent to an isobutylene standard) which are considered consistent with background conditions and not indicative of potential anthropogenic contamination. ERM notes the following exceptions where elevated PID readings were measured:

- ERM notes that elevated PID readings of 32.4 and 16.1 ppm were identified at TP95 at depths of 0.1 m and 0.3 m bgl respectively. ERM notes that during sampling works, no evidence of staining / odour or other indicators of anthropogenic impact were identified within this location. Minor detections above the LOR were reported for both diethyl phthalates (0.6 mg/kg at 0.1m and 0.7 mg/kg at 0.3m depth) and TRH fractions C10-36 and C29-36 (51 mg/kg at 0.1m). Given such minor detections and the lack of identified indicators of anthropogenic contamination, both here and in the surrounding areas, it appears unlikely that this slightly elevated PID reading is indicative of potentially significant anthropogenic contamination.

7.2 Groundwater

To assess groundwater within the Site, ERM undertook a GME in June 2022. Field observations and groundwater gauging information collected during the investigation works are summarised below and presented within **Table 5 - 6** within **Appendix B**. The location of groundwater monitoring wells is presented on **Figure 4**. The location of samples from which analytical results exceeded one or more of the adopted screening values is illustrated on **Figure 6**.

During groundwater gauging, groundwater was identified within the Site at depths ranging from 2.110 m btoc (MW08) to 5.954 m btoc (MW04), groundwater was generally inferred to flow from west to east with the slope of the site. Given the underlying shale and sandstones present on-site there is the potential for preferential flow paths to form through cracks in the formation.

Refer to **Figure 8** – Hydrogeological Information and **Appendix I** – Survey.

During groundwater sampling works groundwater was generally characterised as clear, colourless and odourless with no noticeable odour or sheen. Wells MW01, MW04 and MW06 were noted to be odourless and very turbid with a brown or orange colour with no noticeable odour or sheen.

Field parameters collected during sampling works indicated the following:

- pH ranged from 6.73 (MW04) to 7.29 (MW03) indicating generally neutral conditions;

DRAFT

- Dissolved Oxygen (DO) ranged from 0.5 mg/L (MW05) to 27.9 mg/L (MW03) indicating slightly aerobic to aerobic conditions;
- Conductivity ranged from 11,688 µs/cm (MW06) to 24,267 µs/cm (MW02) indicating brackish / saline conditions which is considered consistent with conditions within the Bringelly Shale formation; and
- Eh (redox potential) ranged from -69.3 mV (MW05) to 11.9 mV (MW06) indicating generally low reduction potential in site groundwater.

ERM notes that during well development, gauging and sampling works, no significant odours, sheen or other indications of anthropogenic contamination were noted.

7.3 Sediment Investigation

Sediment investigation works were undertaken on the 21st June 2022. During investigation works, sediments were noted to be comprised of Dark brown, silty clays. During investigation works, no evidence of anthropogenic contamination such as odours / staining were noted during sampling. The location of sediment samples is presented in **Figure 4.**

7.4 Surface Water

Surface water investigation works were undertaken on the 21st June 2022. During investigation works, surface water description varied between sample locations and were variously noted to be clear, clear with suspended algae, turbid, colourless, white, brown and were noted to have either no odour or a swampy organic odour. During investigation works, no evidence of anthropogenic contamination such as odours / staining were noted during sampling.

The location of surface water monitoring locations is presented on **Figure 4**. The location of samples from which analytical results exceeded one or more of the adopted screening values is illustrated on **Figure 7**.

Field parameters collected during sampling works indicated the following:

- pH ranged from 5.70 (SW07) to 7.30 (SW09) indicating slightly acidic to neutral conditions;
- Dissolved Oxygen (DO) ranged from 0.5 mg/L (SW01) to 30.0 mg/L (SW07) indicating slightly aerobic to aerobic conditions;
- Conductivity ranged from 77.6 µs/cm (SW07) to 1,605 µs/cm (SW05) indicating fresh to mildly brackish / saline conditions; and
- Eh (redox potential) ranged from -78.4 mV (SW01) to 207.9 (SW07) indicating a range of reduction potential in surface waters across the site from reducing to oxidising conditions.

7.5 Analytical Results

7.5.1 Soil Investigation

Sampling locations are presented on **Figure 4**. Tabulated analytical results are presented in **Tables 1 – 1a**. Analytical certificates are presented in **Appendix F.** The location of soil samples where one or more analytes returned a result exceeding the adopted screening values is presented within **Figure 5**.

Laboratory analysis of collected soil samples returned concentrations of CoPCs less than the adopted screening values and / or LOR with the exception the following:

- Zinc exceeding the EILs for urban residential / open space within samples TP303_0.3, TP101_0.1, TP101_0.3, TP104_0.5, TP108_0.1, TP109_0.3, TP117_0.1, TP117_0.2, TP121_0.1, TP133_0.3, TP143_0.1, TP158_0.3, TP170_0.1, TP201_0.3, TP21_0.1, TP21_0.3, TP227_0.3, TP228_0.1, TP255_0.3, TP263_0.3, TP264_0.1, TP86_0.4, TP95_0.3;

DRAFT

- Zinc exceeding the EILs for commercial / industrial land use within samples TP123_0.1, TP228_0.3, TP94_0.3;
- Nickel exceeding the EILs for urban residential / open space land use within samples TP101_0.3, TP108_0.1, TP228_0.3;
- Nickel exceeding the EILs for commercial / industrial land use within samples TP101_0.1, TP123_0.1;
- Copper exceeding the EILs for commercial / industrial land use within sample TP228_0.3;
- PFAS (Sum of PFHxS and PFOS) exceeding the PFAS NEMP 2020 Ecological direct exposure for wildlife diet (Mammalian Diet) and Ecological exposure protective of birds guidelines in sample TP86_0.1

Additional detections were reported above the laboratory LOR but below the adopted screening values in soils for OCPs (Aldrin + Dieldrin, Dieldrin and chlordane), diethyl phthalates, TRH/TPH (various fractions, C10-C40) and various heavy metals (As, Cr, Hg, Pb). No detections above the laboratory LOR were reported in soils for asbestos, OPPs, VOCs, BTEX or PAHs. With the exception of sample TP86_0.1 (mentioned above) there were no reported PFAS detections above the LOR.

7.5.2 Groundwater Investigation

Groundwater well locations are presented in **Figure 4**. Tabulated analytical results are presented in **Table 2a.** Analytical certificates are presented in **Appendix F.** The monitoring well locations where the collected groundwater samples reported one or more result exceeding the adopted screening values are presented on **Figures 6**.

Laboratory analysis of collected groundwater samples returned concentrations less than the adopted screening values and / or LOR with the exception of the following:

- Copper concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in all groundwater monitoring locations. Reported detections ranged from 0.002 mg/L (MW07, MW08) to 0.01 mg/L (MW01);
- Zinc concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in all groundwater monitoring locations with the exception of MW06. The highest concentration was reported at location MW03, recording 0.17 mg/L of zinc in groundwater; and
- Phenanthrene was reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in monitoring well MW05, which recorded a detection of 1 µg/L.

Minor detections of several analytes above the LOR but below the adopted screening values were recorded for heavy metals, including arsenic (MW02, MW07, MW08), lead (MW02, MW03, MW09), chromium (MW02) and nickel (all sample locations); and PAHs including benz(a)anthracene (MW01, MW05), chrysene (MW05), and total PAHs (MW01, MW05). ERM notes that detections above the laboratory LOR were recorded for TRH fractions C10-16 and C10-16 F2-Naphthalene (MW06) and C10-14 (MW01, MW06).

No detections above the laboratory LOR were recorded for PFAS, VOCs/SVOCs, BTEX, OCP/OPP in samples collected from any of the groundwater monitoring locations.

7.5.3 Sediment Investigation

Sampling locations are presented on **Figure 4**. Tabulated analytical results are presented in **Table 3.** Analytical laboratory certificates are presented in **Appendix F.**

Laboratory analysis of collected sediment samples returned concentrations of CoPCs less than the Laboratory LOR for PFAS in all samples.

DRAFT

7.5.4 Surface Water Investigation

Sampling locations are presented on **Figure 4**. Tabulated analytical results are presented in **Table 3.** Analytical laboratory certificates are presented in **Appendix F.** The surface water locations where the collected surface water samples reported one or more result exceeding the adopted screening values are presented on **Figure 7.**

Laboratory analysis of collected surface water samples returned concentrations less than the adopted screening values and / or LOR with the exception of the following:

- PFOS concentrations exceeded the NEMP (2020) (freshwater) guidelines for both: slightly to moderately disturbed ecosystems, and high conservation value systems at locations SW2 (located along the eastern boundary where surface waters flow out of the Site), SW9 (in Moore Gully approximately 200m from the western site boundary) and SW10 (down-gradient of Moore Gully on the eastern site boundary at the vehicle crossing point);
- Copper concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in all surface water monitoring locations. Reported detections ranged from 0.002 mg/L (SW2) to 0.01 mg/L (SW10);
- Zinc concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in all surface water monitoring locations with the exception of SW2. Reported detections ranged from 0.027 mg/L (SW7) to 0.094 mg/L (SW9);
- Nickel concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in two surface water monitoring locations (SW10 and SW6); and
- Lead concentrations were reported in excess of the ANZG (2018) guidelines for slightly to moderately disturbed ecosystems (freshwater) in surface water monitoring location SW4;

Minor detections above the LOR but below the adopted screening values were recorded for PFAS (PFHxA, PFPeA, PFHxS and sum of PFHxS and PFOS), heavy metals (Arsenic, lead, nickel), TRH, Toluene, and VOCs (total MAH) in surface water samples.

7.6 Quality Assurance and Quality Control – Data Usability

A review of the laboratory QA/QC data was completed by ERM. The QA/QC review indicated that results are generally within the relevant DQI acceptance criteria for the analyses conducted. Details of the project QAQC assessment are provided within **Appendix G**.

DRAFT

8. UPDATED CONCEPTUAL SITE MODEL

Based on information reviewed as part the ERM (2021) PSI and in consideration of current and potential future land use scenarios, ERM developed a preliminary Conceptual Site Model (CSM). The below CSM has been updated / refined with information obtained during this DSI.

Table 8.1 Conceptual Site Model

Potential Sources	Pathways	Potential Receptors	Risk of Potentially Complete Pollutant Linkage	Comment
Uncontrolled fill within onsite roads	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Low	■ During investigation works, no fill materials containing potential anthropogenic inclusions were identified within samples collected from within and / or adjacent to onsite roadways. ■ ERM notes that during future construction works, an Asbestos Management Plan (AMP) should be implemented to manage the fill materials identified as likely to contain asbestos within the former married quarters area.
	■ Inhalation of contaminated dust.	■ Current and future site users ■ Workers doing works involving movement / handling etc. of materials	■ Low	
	■ Transport of contamination through surface water flows.	■ Adjacent sensitive ecological receptors. ■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site.	■ Low	
	■ Transport of contamination to underlying groundwater aquifers	■ Adjacent sensitive ecological receptors. ■ Future potential on-site / offsite users of groundwater	■ Low	
	■ Transport of contaminants through mechanical transport	■ Workers carrying out development, installation or maintenance works within the Site	■ Low	

DRAFT

Potential Sources	Pathways	Potential Receptors	Risk of Potentially Complete Pollutant Linkage	Comment
Uncontrolled fill within potential onsite burials	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Low / Moderate	■ During test pitting works, fill materials were identified to be generally consistent across the Site and extending to a maximum depth of 0. 2 m bgl. The area around the former married quarters was the exception to this rule, where shallow fill materials containing minor anthropogenic inclusions were identified at depths to 0.3m. ■ During investigation works, fill materials containing anthropogenic inclusions were limited to the area of the former married quarters. ERM note that while no signs of asbestos were identified within fill materials during test pitting works, past reports indicate there is potential for ACM to be present in the fill within this area. ■ ERM notes that during future construction works, an Asbestos Management Plan (AMP) should be implemented to manage the fill materials identified as likely to contain asbestos within the former married quarters area.
	■ Inhalation of contaminated dust.	■ Current and future site users ■ Workers doing works involving movement / handling etc. of materials	■ Low / Moderate	
	■ Transport of contamination through surface water flows.	■ Adjacent sensitive ecological receptors. ■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site.	■ Low	
	■ Transport of contamination to underlying groundwater aquifers	■ Adjacent sensitive ecological receptors. ■ Future potential on-site / offsite users of groundwater	■ Low	
	■ Transport of contaminants through mechanical transport	■ Workers carrying out development, installation or maintenance works within the Site	■ Low	
Potential Onsite Weed and Pesticide Spraying	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Low	■ No immediate evidence of spraying (dead / dying vegetation) was noted during the Site inspection and as such ERM performed a grid based sampling approach to assess the potential for herbicides and pesticides to be present within the Site.
	■ Inhalation of contaminated dust.	■ Current and future site users ■ Workers doing works involving movement / handling etc. of materials during excavation works	■ Low	

DRAFT

Potential Sources	Pathways	Potential Receptors	Risk of Potentially Complete Pollutant Linkage	Comment
	■ Transport of contamination through surface water flows.	■ Adjacent sensitive ecological receptors. ■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site.	■ Low	■ Laboratory analysis of collected samples returned concentrations of COPCs associated with herbicides less than the LOR. Minor detections of pesticides above the LOR were reported in two adjacent surface soil locations within the area associated with the former married quarters, immediately north of the main access road. Minor detections of Diethyl-phthalates, concentrated in the centre of site, are potentially associated with historic application of insecticides associated with rural land-use. ■ ERM considers there to be a low risk of harm to current and future on-site / off-site receptors from potential contamination associated with onsite weed spraying activities.
	■ Transport of contamination to underlying groundwater aquifers	■ Adjacent sensitive ecological receptors. ■ Future potential on-site / offsite users of groundwater	■ Low	
	■ Transport of contaminants through mechanical transport	■ Workers carrying out development, installation or maintenance works within the Site.	■ Low	
Asbestos Conduits	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Moderate	■ Previous investigations identified the potential for ACM to be present within onsite service pits / conduits. ■ ERM notes that during future construction works, an Asbestos Management Plan (AMP) should be implemented to manage the fill materials identified as likely to contain asbestos within the former married quarters area and any isolated occurrences of fill on the Site.
	■ Inhalation of contaminated dust.	■ Current and future site users ■ Workers doing works involving movement / handling etc. of materials	■ Moderate	
	■ Transport of contamination through surface water flows.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site.	■ Low	

DRAFT

Potential Sources	Pathways	Potential Receptors	Risk of Potentially Complete Pollutant Linkage	Comment
	■ Transport of contamination to underlying groundwater aquifers	■ Future potential on-site / offsite users of groundwater	■ Low	
	■ Transport of contaminants through mechanical transport	■ Workers carrying out development, installation or maintenance works within the Site.	■ Moderate	
General Site Area (PFAS)	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Low	■ ERM notes that PFAS was identified within sample TP86_0.1. Samples collected from underlying materials were noted to be less than LOR. PFAS was further identified within two surface water sample locations up-gradient from TP86. ERM further notes that PFAS was not identified within soil samples collected from any other location or within collected groundwater samples. As such it is the opinion of ERM that this minor detection of PFAS within surface soils and surface water may indicate minor PFAS migration to the Site from runoff associated with dam overflow from the upgradient sources across the western boundary, but is not indicative of significant / widespread contamination across the Site that requires further assessment.
	■ Inhalation of contaminated dust.	■ Current and future site users ■ Workers doing works involving movement / handling etc. of materials	Low	
	■ Transport of contamination through surface water flows.	■ Adjacent sensitive ecological receptors. ■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site.	Low

	■ Transport of contaminants through mechanical transport	■ Workers carrying out development, installation or maintenance works within the Site.	Low	
Potential Offsite Sources of Contamination	■ Dermal contact and / or incidental ingestion with contaminated soils.	■ Current and future site users. ■ Workers carrying out development, installation or maintenance works within the Site	■ Low	■ Analytical results from collected soil and groundwater samples returned concentrations of CoPCs less than LOR and / or the adopted screening values within all collected samples in the majority of cases. Minor exceedances were recorded for heavy metals, in soil, ground and surface water; PFAS in surface water and soils; and Phenathrene in groundwater. ■ Analytical results from collected surface water samples returned concentrations of PFOS in exceedance of the adopted screening value for high conservation value systems and slightly to moderately disturbed ecosystems in three locations, both upstream in the overland surface water flow path running to Moore gully. One soil sample located within Moore gully returned an exceedance of the adopted ecological screening value for PFAS in surface soils at TP86, potentially indicating a minor upstream source of PFAS migrating across the site through surface water flows. Given the planned development of the site into a city centre, these exceedances are unlikely to pose a significant threat to ecological receptors following development of the site.

DRAFT

Potential Sources	Pathways	Potential Receptors	Risk of Potentially Complete Pollutant Linkage	Comment
				■ Analytical results collected from soil and groundwater sampling across the site have reported minor hydrocarbon detections below the adopted screening values. Given there were no identified sources of anthropogenic hydrocarbons during sampling and the presence of non-anthropogenic sources of hydrocarbons have been established on-site during previous investigations these results are unlikely to be indicative of significant, widespread anthropogenic contamination on the site. ■ It is the opinion of ERM that due to the consistency of results throughout the Site and as there is no onsite / offsite source of heavy metals, that the minor exceedances are likely representative of natural background conditions and are not indicative of anthropogenic contamination that requires further assessment or management. ■ As such ERM considers there to be a low risk of harm to current and future on-site / off-site receptors from potential contamination associated with potential offsite sources of contamination.

DRAFT

9. CONCLUSIONS AND RECOMMENDATIONS

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by the Western Parkland City Authority (WPCA or 'the Client') to conduct a Detailed Site Investigation (DSI) of the site identified as the Bradfield development area, located at 215 Badgerys Creek Road, Bringelly NSW (the Site).

ERM undertook a Preliminary Site Investigation (PSI) in June 2021 to refine the understanding surrounding potential contamination associated with recent and historical land use practices undertaken within the Site and surrounding area that may require consideration during future redevelopment works.

Based on information reviewed as part of the PSI, ERM considered there may be a potential risk to human health and / or sensitive ecological receptors associated with a number of current and historical land use practices undertaken within the Site and surrounding area. the completion of a Detailed Site Investigation (DSI) was recommended to further assess the potential for soil and / or groundwater contamination to be present.

This DSI was undertaken in general accordance with the Site Auditor approved ERM (2021) Sampling and Analysis Quality Plan (SAQP) which was developed to describe the required Data Quality Objectives (DQOs) and field investigation methods for undertaking this DSI.

The overall objective of the DSI was to assess the potential existence and distribution / extent of contamination in soil, sediments, surface water, and groundwater and to identify potential remediation / site management requirements to facilitate the subsequent redevelopment works at the Site.

Results of the DSI indicated the following:

- Fill materials were observed to extend to a maximum depth of 0.4 metres below ground level (m bgl). During investigation works, evidence of staining / odours or anthropogenic inclusions such as bricks, rubble, potential Asbestos Containing Material (ACM) etc. was not noted within the majority of fill materials, with the exception of those located in the area around the former married quarters, and an isolated observation of bitumen within topsoil recorded at TP92 in the centre of site immediately north of the overland flow path running through Moore Gully. Based on the consistent depth of fill and the identified nature and extent of fill material within the site it is considered that there is a low risk of significant burials of uncontrolled fill materials within the Site, with the exception of the aforementioned married quarters area;
- Natural materials were generally encountered at surface or at depths ranging between 0.1 and 0.4 m bgl in locations with identified overlying fill. Natural materials were generally comprised of brown and red clays with occasional grey / orange inclusions, varying in stiffness and plasticity to a depth of approximately 2.5 m bgl overlying fine-grained interbedded shale and sandstone bedrock with clay bands to the maximum depth of investigation works. During investigation works, no evidence of anthropogenic staining or odour was identified within natural materials;
- Analytical results of collected soil samples returned concentrations of Contaminants of Potential Concern (CoPCs) less than the laboratory Limit of Reporting (LOR) and / or the adopted screening values within all collected samples with the exception of some heavy metals (copper, nickel and zinc) and one exceedance of the adopted site ecological screening value for PFAS (Sum of Perfluorohexane sulfonate (PFHxS) and perfluorooctane sulfonate (PFOS)). Due to the consistency of results throughout the Site and as there is no identified significant onsite / offsite source of heavy metals, it is the opinion of ERM that the minor detections of heavy metals within soils are likely representative of natural background conditions are not indicative of anthropogenic contamination that requires further assessment:

DRAFT

- ERM notes that PFAS (Sum of PFHxS and PFOS) was identified within surface materials in sample TP86_0.1 at 6.8 µk/kg, in exceedance of the adopted ecological screening values for direct exposure (mammalian diet) (4.6 µg/kg) and bird protection (0.2 µg/kg). The Sample collected from underlying materials within TP86 were noted to return a result less than the laboratory LOR. ERM further notes that PFAS was not identified within groundwater, sediment or soil samples collected from any other location. Exceedances of the adopted ecological screening value for PFOS were reported in three surface water sampling locations and one minor PFAS (Perfluoropentanoic acid (PPeA) and Perfluorohexanoic acid (PFHxS)) detection was reported in an additional surface water location. Two of which occurred within the Moore Gully area, with one location (SW10) located down gradient from TP86 and the other location (SW9) located up-gradient. While there are no identified PFHxS or PFOS sources located within the area it is possible trace levels of PFHxS or PFOS may be migrating from up-gradient sources into the site in surface waters, noting that PFAS is widespread at low levels in urban environments. The remaining surface water location reporting an exceedance of the adopted screening value for sum of PFHxS and PFOS was located on the very eastern boundary, down-gradient from the rest of the site and located on flat land that slopes up to the north towards the vacant areas of site to the north-west and urban-residential properties to the north-east, hence while no identified PFHxS / PFOS sources are present this area likely receives extensive surface water run-off from numerous sources including trace migration of these analytes from up-gradient sources. It is the opinion of ERM that these reported exceedances of total PFHxS and PFOS within surface soils and PFOS within surface water is not indicative of significant / widespread contamination that requires further assessment, and given the proposed development of the site into a city centre, the eventual stripping of surface materials during development and the reported exceedances of the adopted ecological screening value are not considered likely to pose a significant threat following site development;
- Minor detections of TRH were reported in 48 test pit locations across the site. Given the absence of evidence for anthropogenic contamination such as staining, odours, elevated PID readings across these locations and the consistency of results with minor TRH detections reported in soils as part of the First building DSI investigation, ERM does not consider these results indicative of significant anthropogenic contamination. Elevated TRH detections reported at one location, TP167, were submitted to the lab for silica-gel analysis, which returned no detections for anthropogenic TRHs; and
- No potential ACM was identified within fill materials during intrusive investigations within the area of the former married quarters. Given, however, ACM was identified in these areas in past investigations, the potential for ACM to be present in fill within this area remains.

- Sediment samples collected during investigation works from onsite drainage lines / overland flow paths were noted to be comprised of fine grained silty clays. During investigation works, no evidence of anthropogenic contamination such as odours / staining were noted within the sediments collected. Laboratory analysis of collected sediment samples returned concentrations of CoPCs less than the laboratory LOR and / or the adopted screening values indicating that there is a low risk of CoPCs in site sediments migrating via surface water flows throughout the Site or off-site;
- Analysis of surface water samples returned exceedances of the adopted screening values for various heavy metals including copper (all locations), Zinc (SW1, SW3 – SW10), Nickel (SW6, SW10) and Lead (SW4), and PFOS (SW2, SW9, SW10). Given the consistent detection of heavy metals in surface water as well as in soil and groundwater across the site and the absence of a likely source, ERM consider these are likely representative of natural background concentrations and not indicative of anthropogenic contamination:

DRAFT

- Exceedances of the adopted screening values for PFOS were reported in 3 locations. Given two of these exceedances occurred within the Moore Gully area, in which a surface soil reported an exceedance of the ecological screening value for sum PFOS and PFHxS, ERM consider there may be the potential for minor PFOS migration to be occurring to the site from up-gradient sources. Given the proposed development of the site into a city centre, the reported exceedances of the adopted ecological screening value are considered unlikely to pose a significant threat to future site receptors.

- Groundwater was identified within the Site at depths ranging from 55.278 m AHD (MW11) to 74.537 m AHD (MW08). During groundwater sampling works, no indication of sheen, odours or other visual / olfactory indicators of contamination were noted;
- Analytical results of collected groundwater samples returned concentrations of CoPCs less than LOR and / or the adopted screening values within all collected samples with the exception of minor exceedances of the ANZG freshwater screening values for heavy metals and phenanthrene. It is considered that based on identified heavy metals detected within soils and site conditions observed during completion of this DSI, that the identified slightly elevated heavy metals concentrations within the analysed groundwater samples are likely representative of natural background conditions are not indicative of significant anthropogenic contamination that requires further assessment:
  - Minor detections of PAHs were reported in well MW01 in addition to the exceedance of phenanthrene reported at MW05. It is noted that while the recommended 99% species protection value has been applied for Phenanthrene as per the advice included in the ANZG, the reported detection is under the default guideline value for 95% species protection. Given this, and the proposed future land use of the site as a commercial hub, the reported marginal exceedance of the ANZG guidelines for phenanthrene in well MW05 is not considered to pose a significant threat to future ecological receptors on the site due to the isolated nature of the exceedance and likely limited number of ecological receptors present following redevelopment works; and
  - ERM notes that minor TRH concentrations above the LOR were identified within MW01 and MW06. As no evidence of anthropogenic hydrocarbon contamination was identified during drilling and / or groundwater gauging works ERM does not consider these results indicative of widespread or significant anthropogenic contamination, or as a potential risk to future site receptors.

Based on field observations made during site investigations works, results of collected soil, groundwater, surface water and sediment samples and in consideration of the updated CSM presented within Section 8, it is the opinion of ERM that the site is suitable for the proposed development.

ERM recommends that prior to the commencement of construction works an Asbestos Management Plan (AMP) should be implemented. The purpose of the AMP will be to manage the fill materials within the former married quarters area previously identified as containing ACM and also the potential for asbestos containing conduits to be encountered during earth works.

Table 5. Groundwater Gauging Results
Bradfield City Centre
0571466 - Detailed Site Investigation

Well ID	Gauging Date	Event	Screened interval (mbTOC)	Total Measured Depth (mbTOC)	Depth to PSH (mbTOC)	Depth to Water (mbTOC)	PSH Thickness (m)	Well Condition/Comments
MW01	24/Jun/22	GME	10.1 - 13.1	13.560	--	4.53	--	grey-brown, very turbid, no odour.
MW02	24/Jun/22	GME	5.5 - 8.5	13.685	--	2.388	--	Clear, no odour.
MW03	24/Jun/22	GME	4.5 - 7.5	8.668	--	2.856	--	Clear, no odour.
MW04	24/Jun/22	GME	10.2 - 13.2	13.208	--	5.959	--	grey-brown, very turbid, no odour.
MW05	24/Jun/22	GME	7.4 - 10.4	9.149	--	3.684	--	Brown, turbid, no odour.
MW06	24/Jun/22	GME	2.0 - 5.0	--	--	3.215	--	Orange-brown, very turbid, no odour.
MW07	24/Jun/22	GME	14.0 - 21.5	20.008	--	9.721	--	Clear, no odour.
MW08	24/Jun/22	GME	5.1 - 8.1	9.022	--	2.110	--	Clear, no odour.
MW09	24/Jun/22	GME	8.9 - 11.9	10.072	--	2.482	--	Clear, no odour.
MW10	24/Jun/22	GME	8.85 - 11.85	12.950	--	3.651	--	
MW11	24/Jun/22	GME	2.9 - 5.9	6.465	--	5.671	--	No odour.

DRAFT

Well ID	DO (mg/L)	EC (µScm-1)	pH	Eh (mV)	Temp. (°C)	Comments
MW01	0.50	23684	6.98	-45	16.2	
MW02	0.62	24267	6.89	-55.9	15.8

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 80 (1-10 x EQL); 50 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary la

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 80 (1-10 x EQL); 50 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 80 (1-10 x EQL); 50 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

0571466 - ID Request

Jack Emblen <Jack.Emblen@erm.com>

Fri 2/4/2022 5:26 PM

To: John Nguyen <JohnNguyen@eurofins.com>

Cc: Nicholas Grbich <Nicholas.Grbich@erm.com>

CAUTION: EXTERNAL EMAIL - Sent from an email domain that is not formally trusted by Eurofins.

Do not click on links or open attachments unless you recognise the sender and are certain that the content is safe.

Hi John,

Bit of an annoying request for you but can we please get our sample ID's re-named for the below lab reports? We need to prefix "AI_" added to the front of every sample ID and reports re-issued due to clashes with prior sampling rounds occurring in ESDAT.

So for example, sample "1B_TP01_0.1" would become "AI_1B_TP01_0.1"

Reports:

- 846063
- 835522
- 837639
- 836571
- 838531
- 838539
- 842812
- 846063
- 853609
- 838532
- 838534
- 838536
- 838537
- 838539
- 841164
- 852528
- 852729
- 853214

I appreciate it's a big list but your help would be much appreciated on this one.
Kind Regards,

Jack Emblen
Environmental Consultant

Sample Receipt Advice

Company name:	ERM Sydney
Contact name:	Nicholas Grbich
Project name:	WPCA BCC
Project ID:	0571466
Turnaround time:	5 Day
Date/Time received	Oct 27, 2021 2:55 PM
Eurofins reference	836571

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✓	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

1B_20211027_T01 - T03 forwarded to ALS; T02 received only PFAS jar. TP169_0.4 received as TP169_0.3. Extra samples TP159_0.3 and 1B_TP27_0.4 received, logging on hold. 1B_TP18_0.4 PFAS container not received, canceled PFAS analysis. TP159_0.1 not received, cancelling analysis. 1B_20211027_D03 not received analysis cancelled. 1B_20211027_D02, 1B_20211027_D04 glass jar not received, please advise on tests from PFAS jar. Received 1B_20211027_T04 as PFAS jar only on 5/11 please confirm if it is still to be forwarded to ALS.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

John Nguyen on phone : or by email: JohnNguyen@eurofins.com

Results will be delivered electronically via email to Nicholas Grbich - nicholas.grbich@erm.com.

Note: A copy of these results will also be delivered to the general ERM Sydney email address.

Certificate of Analysis

ERM Sydney
Level 15, 309 Kent St
Sydney
NSW 2000

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025–Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Attention:	Nicholas Grbich
Report	836571-AID-V2
Project Name	WPCA BCC
Project ID	0571466
Received Date	Oct 27, 2021
Date Reported	Feb 07, 2022

Methodology:

Asbestos Fibre Identification	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. *NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.*
Unknown Mineral Fibres	Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as Electron Microscopy, to confirm unequivocal identity. *NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an independent technique.*
Subsampling Soil Samples	The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed. *NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.*
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination.The resultant material is then further examined in accordance with AS 4964 - 2004. *NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.*
Limit of Reporting	The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). *NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos".This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH.*

Internal Quality Control Review and Glossary General

1. QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Samples were analysed on an 'as received' basis.
4. Information identified on this report with the colour **blue** indicates data provided by customer that may have an impact on the results.
5. Information identified on this report with the colour **orange** indicates sections of the report not covered by the laboratory's scope of NATA accreditation.
6. This report replaces any interim results previously issued.

Holding Times

Please refer to the most recent version of the 'Sample Preservation and Container Guide' for holding times (QS3001).
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported. Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

Units

% w/w:	Percentage weight-for-weight basis, e.g. of asbestos in asbestos-containing finds in soil samples (**% w/w**)
F/fld	Airborne fibre filter loading as Fibres (**N**) per Fields counted (**n**)
F/mL	Airborne fibre reported concentration as Fibres per millilitre of air drawn over the sampler membrane (**C**)
g, kg	Mass, e.g. of whole sample (**M**) or asbestos-containing find within the sample (**m**)
g/kg	Concentration in grams per kilogram
L, mL	Volume, e.g. of air as measured in AFM (**V** = **r** x **t**)
L/min	Airborne fibre sampling Flowrate as litres per minute of air drawn over the sampler membrane (**r**)
min	Time (**t**), e.g. of air sample collection period

Calculations

Airborne Fibre Concentration: $C = \left(\frac{A}{a}\right) \times \left(\frac{N}{n}\right) \times \left(\frac{1}{r}\right) \times \left(\frac{1}{t}\right) = K \times \left(\frac{N}{n}\right) \times \left(\frac{1}{V}\right)$

Asbestos Content (as asbestos): $\%\, w/w = \frac{(m \times P_A)}{M}$

Weighted Average (of asbestos): $\%_{WA} = \sum \frac{(m \times P_A)_x}{x}$

Terms

%asbestos	Estimated percentage of asbestos in a given matrix. May be derived from knowledge or experience of the material, informed by HSG264 *Appendix 2*, else assumed to be 15% in accordance with WA DOH *Appendix 2* (**P_A**).
ACM	Asbestos Containing Materials. Asbestos contained within a non-asbestos matrix, typically presented in bonded (non-friable) condition. For the purposes of the NEPM and WA DOH, ACM corresponds to material larger than 7 mm x 7 mm.
AF	Asbestos Fines. Asbestos contamination within a soil sample, as defined by WA DOH. Includes loose fibre bundles and small pieces of friable and non-friable material such as asbestos cement fragments mixed with soil. Considered under the NEPM as equivalent to "non-bonded / friable".
AFM	Airborne Fibre Monitoring, e.g. by the MFM.
Amosite	Amosite Asbestos Detected. Amosite may also refer to Fibrous Grunerite or Brown Asbestos. Identified in accordance with AS 4964-2004.
AS	Australian Standard.
Asbestos Content (as asbestos)	Total % w/w asbestos content in asbestos-containing finds in a soil sample (**% w/w**).
Chrysotile	Chrysotile Asbestos Detected. Chrysotile may also refer to Fibrous Serpentine or White Asbestos. Identified in accordance with AS 4964-2004.
COC	Chain of Custody.
Crocidolite	Crocidolite Asbestos Detected. Crocidolite may also refer to Fibrous Riebeckite or Blue Asbestos. Identified in accordance with AS 4964-2004.
Dry	Sample is dried by heating prior to analysis.
DS	Dispersion Staining. Technique required for Unequivocal Identification of asbestos fibres by PLM.
FA	Fibrous Asbestos. Asbestos containing material that is wholly or in part friable, including materials with higher asbestos content with a propensity to become friable with handling, and any material that was previously non-friable and in a severely degraded condition. For the purposes of the NEPM and WA DOH, FA generally corresponds to material larger than 7 mm x 7 mm, although FA may be more difficult to visibly distinguish and may be assessed as AF.
Fibre Count	Total of all fibres (whether asbestos or not) meeting the counting criteria set out in the NOHSC:3003
Fibre ID	Fibre Identification. Unequivocal identification of asbestos fibres according to AS 4964-2004. Includes Chrysotile, Amosite (Grunerite) or Crocidolite asbestos.
Friable	Asbestos-containing materials of any size that may be broken or crumbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is outside of the laboratory's remit to assess degree of friability.
HSG248	UK HSE HSG248, *Asbestos: The Analysts Guide*, 2nd Edition (2021).
HSG264	UK HSE HSG264, *Asbestos: The Survey Guide* (2012).
ISO (also ISO/IEC)	International Organization for Standardization / International Electrotechnical Commission.
K Factor	Microscope constant (**K**) as derived from the effective filter area of the given AFM membrane used for collecting the sample (**A**) and the projected eyepiece graticule area of the specific microscope used for the analysis (**a**).
LOR	Limit of Reporting.
MFM (also NOHSC:3003)	Membrane Filter Method. As described by the Australian Government National Occupational Health and Safety Commission, *Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres*, 2nd Edition [NOHSC:3003(2005)].
NEPM (also ASC NEPM)	National Environment Protection (Assessment of Site Contamination) Measure, (2013, as amended).
Organic	Organic Fibres Detected. Organic may refer to Natural or Man-Made Polymeric Fibres. Identified in accordance with AS 4964-2004.
PCM	Phase Contrast Microscopy. As used for Fibre Counting according to the MFM.
PLM	Polarised Light Microscopy. As used for Fibre Identification and Trace Analysis according to AS 4964-2004.
SMF	Synthetic Mineral Fibre Detected. SMF may also refer to Man Made Vitreous Fibres. Identified in accordance with AS 4964-2004.
SRA	Sample Receipt Advice.
Trace Analysis	Analytical procedure used to detect the presence of respirable fibres (particularly asbestos) in a given sample matrix.
UK HSE HSG	United Kingdom, Health and Safety Executive, Health and Safety Guidance, publication.
UMF	Unidentified Mineral Fibre Detected. Fibrous minerals that are detected but have not been unequivocally identified by PLM with DS according the AS 4964-2004. May include (but not limited to) Actinolite, Anthophyllite or Tremolite asbestos.
WA DOH	Reference document for the NEPM. Government of Western Australia, *Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia* (updated 2021), including Appendix Four: *Laboratory analysis*
Weighted Average	Combined average % w/w asbestos content of all asbestos-containing finds in the given aliquot or total soil sample (**$\%_{WA}$**).

DRAFT

Comments

This report was revised V2 to include prefix "AI_" to all samples as requested.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Asbestos Counter/Identifier:

Bennel Jiri	Senior Analyst-Asbestos (NSW)
Chamath JHM Annakkage	Senior Analyst-Asbestos (NSW)

Authorised by:

Sayeed Abu	Senior Analyst-Asbestos (NSW)
